## CLASS AND CULTURE: THE CASES OF KIRIKKALE AND ANKARA

A Ph. D. Dissertation

Presented by

Hayriye ERBAŞ

to

the Graduate School of Social Sciences of Middle East Technical University in Partial Fulfillment for the Degree of

**DOCTOR OF PHILOSOPHY** 

in

**SOCIOLOGY** 

MIDDLE EAST TECHNICAL UNIVERSITY

**ANKARA** 

September, 1993

Approval of the Graduate School of Social Sciences.

Prof.Dr.Haluk KASNAKOĞLU Director

I certify that this thesis satisfies all the requirements as a thesis for the degree of Doctor of Philosophy in Sociology.

Prof.Dr.Bahattin AKŞİT Chairman of the Department

We certify that we have read this thesis and that in our opinion it is fully adequate, in scope and quality, as a thesis for the degree of Doctor of Philosophy in Sociology.

Prof.Dr.Bahattin AKŞÎT
Supervisor

Examining Committee in Charge:

Prof. Dr. Bahattin AKŞİT

Assoc. Prof. Dr. M. Aytül KASAPØĞLU

#### **ABSTRACT**

CLASS AND CULTURE: THE CASES OF KIRIKKALE AND ANKARA

ERBAŞ, Hayriye

Ph.D in Sociology

Supervisor: Prof. Dr. Bahattin AKŞİT

September, 1993, 262 pages

This study elaborates useability of Wright's social class model which is developed for the analysis of class formation and class structure of advanced capitalist societies, for the analyses of the same phenomenon in urban communities of newly industrial capitalist societies, such as Turkey. For this purposes, the model has been comprehended in accordance with other class models; and its decisive conceptualization of social class, based on relation of exploitation has been identified. Then, its basic concepts and premises about advanced capitalist societies have been elaborated with their problems, under the titles of class boundaries, class formation. The model has also been modified with respect to peculiarities of Kırıkkale and Ankara. Survey research and evaluations have been made through this new model of analysis. Lastly, explanatory power of class concepts have been elaborated through some selected variables, such as religious and political actions.

Comprehension on issue has been carried out by a comparative approach, on Kırıkkale, a middle sized industrial city and Ankara national capital. Some further comparisons have also been realized with advanced capitalist societies, USA and Sweden.

In this context, it is argued that Wright's model of social class are

suppressed by capitalism bias and economic reductionism. It comprehends

economic relations i.e., relations of exploitations as the determinants of other

social relations. Thus, it misunderstood non economic factors, such as influences

of clientalism in Turkey. Model disregards some of the persons who are un-

integrated with capitalism within relations of production. Also, it disregards

differences between economic sectors, when deciding class boundaries, such as

manufacturing and tourism; and between forms of ownership of means of

production, such as private and state ownerships in Turkey. Then, class categories

which are in usage have less or no power to explain other social occurrences.

On the other hand, Wright's model also enable us to see that studied

urban territories have gained characteristics of class society which has class

categories peculiar to capitalist societies. Also, it has seen as a decisive aspects for

these two communities that contradictory class locations are widely expanded,

which show both advance in capitalism through experts, supervisors and

managers and also resisting against capitalism through small employers, petty

bourgeoisie and petty traders as well as casual workers.

Keywords: Class, Culture, Social Change, Town and City, Industrialization and

Social Change.

SINIF ve KÜLTÜR: KIRIKKALE ve ANKARA ÖRNEKLERİ

ERBAŞ, Hayriye Doktora Tezi, Sosyoloji Bölümü Tez Yöneticisi: Prof. Dr. Bahattin AKŞİT EYLÜL, 1993, 262 sayfa.

Bu çalışmada, gelişmiş kapitalist toplumlar için hazırlanmış olan Wright'ın sınıf modelinin, yeni kapitalistleşmekte/ gelişmekte olan Türkiye kent topluluklarının çözümlenişinde kullanılabilirliği irdelenmiştir. Bu amaçla öncelikle bu modelin diğer sınıf modelleri içindeki yeri ve sömürü değişkeni aracılığı ile benimsediği temel sınıf tanımı belirginleştirilmiş; daha sonra gelişmiş kapitalist topluluklar için geçerliliğini savunduğu temel önermeler, sınıf sınırları ve sınıf oluşumu başlıkları altında ele alınmış; karşılaştığı sorunlar tartışılmıştır. Ardından, incelenecek kentlerin özelliklerine göre modelde değişiklikler yapılmış; araştırma ve değerlendirme bu yeni model üzerinde gerçekleştirilmiştir. Son olarak ise, kullanılan yeni sınıf modelinin açıklayıcılığı, siyasal tercih, dinsel davranış gibi seçilmiş belli değişkenler üzerinde irdelenmeye çalışılmıştır.

Değerlendirmeler, orta büyüklükte bir sanayi kenti olan Kırıkkale ve metropol büyüklüğünde bir yönetim/hizmetler kenti olan Ankara'ya ait veri tabanı üzerinde, kısmen karşılartırmacı bir yaklaşım çerçevesinde gerçekleştirilmeye çalışılmıştır. Aynı karşılaştırma, çok daha az oranda da olsa gelişmiş ülkelerin kentsel sınıf yapıları ile de yapılmaya çalışılmıştır. Bu çerçevede, Wright'ın

modelinin genel olarak sınıf modellerinin ortak kapitalizm yanlılığı ile yüklü ve

ekonomik indirgemeci oldukları yargıları benimsenmiştir. Ekonomik ilişkileri i.e.

sömürü ilişkilerini, diğer toplumsal ilişkilerin belirleyicisi olarak kurgular, böylece

ekonomi dışı faktörleri de, örneğin Türkiye'de siyasal örgütlenmenin klientalist

niteliğinden kaynaklanan etkileri yanlış algılar ya da algılayamazlar. Model

kapitalizm ile üretim ilişkileri içinde bütünleşmemiş insanları gözden kaçırır.

Sanayi ve hizmetler gibi çalışma sektörleri arası farklılıkları; kamu ve özel mülkler

gibi mülkiyet biçimlerinden kaynaklanan farklılıkları sınıf sınırlarını belirlemede

hesaba katamaz. Sonuçta kullanılan sınıf kategorilerinin diğer toplumsal oluşumlar

üzerindeki açıklayıcı gücü önemli oranda sınırlıdır; hatta yoktur.

Tüm bunlara karşın bir çözümleme modeli olarak kullanıldığında,

irdelenen kentlerin kapitalist sınıf toplumu niteliğini önemli oranda kazandıklarını

gösterir. İncelenen kentlerin ayırtedici özelliği olarak, hem küçük ölçekli iş

sahipliği, düzensiz koşullarda işçilik gibi, kapitalist ilişkilere geçiş sürecine direnci

işaret eden; hem de kapitalist gelişmenin göstergeleri olan uzmanlık, denetcilik,

yöneticilik gibi ara sınıf kategorilerinde şişkinlik saptanabilir.

Anahtar Kelimeler: Sınıf, Kültür, Toplumsal Değişme, Kasaba ve Kent, Sanayileşme

ve Toplumsal Değişme.

#### **ACKNOWLEDGEMENTS**

Research and evaluations will probably be more pleasant for me if I can keep my beliefs on efficiency of class analysis using Marxist theory as I particularly have from the beginning. Unfortunately, my cognition about very basic natures of social classes with their formation and consequent structures and about their social 'functions' have largely been changed during the period of preparation of the present thesis. Fortunately, I hope I have achieved some clues for further class analysis without any pre-occupations about their nature and functions.

Besides enthusiasms, I have gained not only of some ability on survey research but also brought a chance to see friendly relations within academy through the exemplars of Prof.Dr. Bahattin Akşit, Assoc. Prof. Dr. Yakin Ertürk, and Assoc, Prof. Dr. Y. Ziya Özcan at the various stages of the study. They have, in fact, directly participated into study financed by MERC on `Comparative Project on Class Structure and Class Consciousness' for their particular emphases.

Also, I feel that similar kind of friendly relations among students of class analysis which I can see at 'VI'th International Meeting on Comparative Project on Class Structure and Class Consciousness, Grenada, Spain' have positively influenced me to continue on.

It must also be pointed out that this study can not be achieved if MERC has not financed such a study. Naturally, I say that all failures are my own besides my all mentioned gratitude.

#### CHAPTER I

#### INTRODUCTION

This study basically attempts to analyze class structures in a middle sized industrial city, Kırıkkale and the national capital of Turkey, Ankara, with larger and denser population as well as much more central position within national totality. The analyses will be done in accordance with the model of Wright which makes also analyses be comparable to the other national cases comprehended "Comparative Project on Class Structure and through Consciousness." In other words, this study has been focused itself on Wright's model of social classes rather than to elaborate all available class conceptions and to decide to best model; due not only to its prominence over international sociological scene but my belief on its' capability of containing most of operational categories generated by other class conceptions have already be available in sociological thought.

The class analyses in two cities mentioned above can also

provide a data base to think about reliability and validity of class conceptions, which are constructed mainly for the analysis of advanced capitalist societies of Western World, onto the cases of newly capitalist non-western social formations. Thus, we can not only decide to how social transformation and class formation is interrelated, or how much capitalist class society have been appeared in surveyed cases; but also decide to what conceptual and analytical tools for such an analyses are, i.e. categories of operational definitions of social classes in a newly-industrializing non-western capitalist social formation.

#### 1. Literature Review

Theoretical debate on social class has wide range of issues which may grow even faster than the class analysis. Hindess (see Clegg and Emmision, 1991; 32), pointed out class formations and identifications as two basic fields of issue in class analysis in which second one has look at structural characteristics of social classes, such as age, sex and their relations with behaviors, such as voting; whereas former one looks for how social classes have formed, reconstructed or structured (Golthorpe, 1983) themselves as the actors of social transformation. I think, three fields of research can also be identified for didactic, heuristic purposes as 1) research on class formation; 2) research on class relations; and 3) research on explanatory power of

social class conceptions over other spheres of social reality or totality in which social classes are only particular realities.

The units of analysis for these three groups are not mutually exclusive but rather interrelated with each other. Analysis on class formation provides information not only on how much studied community can get characteristics of class one but also on whether class formation have accelerated towards pluralization or polarization; and realized in violent or peaceful conditions. Last questions have also reflect an implicit belief on `revolutionary potential' of social classes as the actors of social changes. However, role of social classes in social and political transformation has also reflect assumption of class struggle shaping as violent conflict between antagonists social classes in history. Thus, questions for sociological analysis hesitating on class struggle when there is no violent conflict have largely been shaped around issues whether class relations are segregative or integrative in any fields of social life.

On the other hand, all these debates have shared a common belief on what social class are. Goldthorpe (1968a; 1968b; 1969) as one of father of the founders of studies on class formations rather than class structure or Giddens (1983) with his very famous emphasis on 'structuration' have also shared very basic definitions of social classes

on the basis of economic categories. Thus, class formation is only possible if economic bases, i.e. capitalist market relations are available. If capitalism has no reality, there is no room for class formations. All other social groups are social groups with their particular basis but not social classes. This is a kind of `capitalism biased' which can make class analysis as a field of research for academic purposes only with have no relations to social relations and transformations. This may be one of the very basic reason for why class conceptions or construction are already in use although they have no explanatory power for social actions in any kind.

In this frame of reference, I think that basic question for class analysis has to be constructed on what social classes are rather then how they are formed or functioning in social or political transformations. Therefore, related literature have been considered in accordance with their decisive contributions into class conceptions rather than their analysis on class formations, relations and explanatory power over social reality.

Class debate generated itself as a conflict between Marx and Weber. (Reissman,1965; Bendix and Lipset ed., 1966) Marx has basically argued that 1) social history is the history of class struggle; 2) social classes (and also political, cultural and other superstructural

features) are determined by their economic bases; 3) social classes have tendency towards polarization into two basic classes as the intermediary ones have a tendency to shrink in one of them. Thus, class relations between basic classes have already gone into class struggle (Tumin, 1967; Lockwood, 1988; Parkin, F., 1979; So, et.al., 1990).

declared himself as bourgeois Marx, i.e. Weber, as contrasting mirror image of Marx, argued with his characteristic historicist emphasis that 1) social classes are social groups specific to capitalist societies on which they have been identified on the basis of market relations (Weber, M., 1966). In other words, there is also classless society before class society; preceding market and money economy. Also, 2) social classes are not simple economic categories but status (or prestige) groups; and their 'grouping' has determined by their economic positions if the economy is defined as the relations of production, i.e. work places; but social classes are determined by their members' position on consumption relations; 3) thus, there is no tendency to polarization, manifesting itself as the class struggle, as Marx assumed, but a plurality of social classes in which each class legitimizes others as the prestige groups are stratified in social organization.

Thus Weber proposes a model of social stratification in order to analyze social groupings rather than social classes alone. This make him able to get theoretical room for non-economic or non-consumptional factors, such as political and cultural ones influencing social stratification in a similar way of what Lockwood (1988) say for utilitarianism and Parsons. This capability of his approach makes him as influential on contemporary class conceptions as his antagonist.

In fact, Weber's influences on later class theoritians not only generating from his own theoretical strength but also from contemporary capitalism generating a huge amount of employment facilities in non-industrial areas, i.e. service jobs performed in offices. The `informal sector's job opportunities' in underdeveloped capitalist societies have also similar characteristics with non-industrial works (Hart, :1973; Quijano, 1974; Geertz, 1963a; 1963b; Moser, 1978; Gerry and Brommley (eds.): 1979; Gerry and Birkbeck, 1981; Scott, 1979; Sethureman, 1978). Contemporary capitalism is also a media society in which class boundaries can easily be penetrated by media networks which may make class conscious of economically antagonistic classes be fused into each other.

In such a complex network of social relations, C. Wright Mills (1951; 1956) paid his own attention to managers' class position in a

developed capitalist society, USA and concluded that they are a part of middle classes; separate from capitalists because they have no property ownership on means of production, and they are different from classical wage workers because they have a power on regulation of work. Thus, besides property ownership, the authority over management has also determined persons' locations in social class structure.

Dahrendorf, (1959) in Germany also tried to study same phenomena by emphasizing that distribution of authority has as much influence as the distribution of means of production on social classes. Capitalism has a new stage, Marx couldn't see, which is characterized by de-composition of capital and labor which is declared themselves as middle classes. That is, ownership of capital has lost its determinance over capitalism to `managers;' and labor, generates within itself new sub-sects, not only in the form of managers but also in the forms of aristocracy of labor and other skilled industrial and non-industrial wage works.

Goldthorpe, Lockwood and Bechhofer (1968a, 1968b, 1969) have conceptualized `affluent classes' as the classes consisting not only of skilled industrial and office workers but also classes of small scale self employed occupants; because they have more money than classical

unskilled industrial workers. In other words, they pay attention to the importance of income level determining class position of individual man. Also, class categories should be dismissed off if they have no power on explaining individuals perceptions and relations with self and others. They are attempts to eliminate such insufficiencies of structuralist and individualist approaches.

Poulantzas (1973; 1975; 1977; 1983) has also a similar line of thought by which agreed on, for capitalist mode of production, emphasizing class pluralization rather than polarization. First, he strictly defines social classes (and other social groups) on the basis of individuals' position on divisions of ownership and labor. He identifies a list of 'old and new petty bourgeoisies'. However, Poulantzas also argued that social classes can only be formed by being conscious and active at political scene through class struggle. If there is no class struggle, there is no social class. Thus, Poulantzas identified only two social classes of bourgeoisie and working classes which he called as the basic classes. And then, for him, other social classes are not the social classes but social stratum and categories.

In fact, Poulantzas has already suppressed with very basic problem of Marxism, economic and political reductionism. Thus, first, he had to define social classes as economic categories; and then he had to identify them as the political agents. In other words, for Poulantzas, economic categories have to be political agents and any political agent has to have an economic basis simultaneously.

These kinds of problems have been tackled by Carchedi (1977) He propose that social classes have to be analyzed at two different levels of abstraction, namely mode of production and social formation. Modes of production which consist of relations of production generating their own peculiar class divisions. On the other hand, social formation which consists of coexistence of different modes of production under one of their dominance has also generated further class divisions through its particular economic, political, cultural and ideological levels. In this frame of reference, non-economic social groups can also be taken into considerations as social classes, such as ruling classes and ruled social classes as Poulantzas pointed on. Thus, basic question is not only defined within economic spheres but also relations between economic base and non-economic superstructural levels. In other words, issue on class analysis has still the relationships between economic and non-economic spheres but not social classes in themselves.

Parkin (1974; 1983) focuses his attention on social classes within themselves by emphasizing concept of social closure. He argued

that social class can take the power as they have increased their internal closure within themselves. In other words, he identifies the maturity of social classes on the basis of their members' closeness to each other but not on the basis of their members' identification to economic class interests.

Class debates have also accelerated on the basis of underdeveloped capitalist societies' realities generating 'informal commodity sector' and `simple mode of production' conceptualizations. There are many individuals who can not be taken into consideration through conventional class categories constructed for developed nations. These people are not the people whom they are in Weber's social castes or strata in alienation from private property and market relations. Although, they had been conceptualized by some of the Weberian modernization theoritians as traditional social groups which are in transition towards modernity as they are being integrated with market economy; they are also conceptualized as strictly integrated or articulated into 'modern economy'. In both arguments, Marxism and Modernism classify these people with respect to their economic characteristics on their employment conditions, i.e. relations of production either under the names of informal sector or simple commodity mode of production.

In other words, both schools of thought, originating from modernism and dependency conceptualizations, ignores the role of social and cultural factors on class formation in (or at least dominated by) modern economic system (Akşit, 1985; Taylor, 1979). Hence, social and cultural factors have only been taken into consideration with respect to economic factors which are assumed as the basis of social classes. In this framework, studies of cultural factors have their significance by their role on economic development so called as modernization under the name of modernity defined as human consequences or preconditions of modernization. They are generally evaluated either suppliers or obstacles on development. Thus, the question of class formation looks for the parallelism between economic and cultural activities.

In other words, considering the role of culture has not necessarily mean respecting the people's self esteem-power to shape their own destiny or class position. Role of culture on determining of social class has generally been argued as an indicator of traditionalism which has to be abandoned. This is one of the predominant reason of why cultural factors have been generally accounted by Weberian modernists to elaborate social classes in underdeveloped societies. In fact, these are not the social classes in Weberian sense; but they are

stratum which Weber generates to clarify the societies which have no internal potential of growth.

# Basic Premises and Concepts of E. O. Wright

Wright is an attempt towards producing an analytical model and structured means to comprehend class differences on concrete social reality mainly with respect to Marxism (Bloom, and Kivienen, 1987). Thus, his model also is an attempt to eliminate analytical insufficiencies or unuseability of Marxist class conceptions for observation. Such unuseability is apparent mainly in Marx and Engels' own works. They have used various class concepts whereas they have too little explicitly defined criteria on how analysts can define class boundaries separating them from each other in the context of social relations. Poulantzas, as a brilliant Marxist analysis for improving Marx and Engels' class conception has also some of the criteria to identify class boundaries but not structured means of observation, data collection and data processing.

Wright (1978) constructs his own class conception, which is peculiar for capitalist society, on the basis of the issue of exploitation. He operationalizes his concept of exploitation through three items,

ownership of means of production, using and controlling of others' labor. Thus, he is going to search on class analysis at the levels of relations of production and mode of production as the mode of production has been defined as a combining system of activities of production, distribution and consumption. Wright explorates his own class categories, on a spatial analogy, as the locations of persons through social arena or relations of exploitation under two main titles as the basic and contradictory locations; hereafter they can also be called as basic and contradictory social classes.

In other words, he argued that any single mode of production has not only two antagonistic-polarized basic social classes but also contradictory class locations in itself. Also, there are more contradictory class locations than the contradictory class locations of articulated modes of production where additional locations have been occurred through articulating or mediating mechanisms between modes of productions.

Capitalist society is a social formation where simple commodity mode of production (SCMP) and capitalist mode of production (CMP) have been articulated under the dominance of the second. Thus, any capitalist social formation, free from their gradual position on capitalist development, has basic class locations (BCL's) and

contradictory class locations (CCL's) of SCMP and CMP as well as additional CCL's specific to capitalist social formation. Thus, it can also be assumed that differences between developed and underdeveloped capitalist social formations correspond to quantitative differences rather than qualitative ones. Although all BCLs and CCLs could be seen in any capitalist social formation; quantitative weights of existing BCL's and CCL's have many differences in developed and underdeveloped capitalist social formations.

In this theoretical frame of references, Wright identifies his own peculiar class categories for advanced capitalist society in two steps. First, he identifies three basic locations of bourgeoisie, proletariat and petty bourgeoisie as the basic class locations; and managers, supervisors, small employers and semi-autonomous wage earners as contradictory class locations. Second, he conceptualizes experts instead of semi-autonomous wage-earners because semi-autonomous wage earners have largely be defined considering market relations i.e., domination rather than exploitation i.e., relations of production. This is well indicated through Wright's identifications on operational characteristics petty bourgeoisie, small employers and wage earners.

Table-1: Wright's Identifications of Class Categories

	Make Work Place Policy Decisions	Supervise Others	Credentials Typically Required in Occupation	Self Employed	Employ others (2 or more)
Managers	Yes			No	No
Supervisors	No	Yes	••••	No	No
Experts	No	No	Yes	No	No -
Workers	No	No	No ·	No	No
Petty Bourgeoisie				Yes	No
Small Employers				Yes	Yes

## 1. 3. Defining Class Boundaries:

Basic Premisses and Concepts of

#### Research

The weakest ring of Wright's model has been found out at that point where it emphasizes on categorization of class locations as quantification of exploitation. Therefore, it lost not only of differences among proletariat but also differences among employers who are not necessarily capitalists but can also be state bureaucracy as in Kırıkkale. This incapability to grasp differences among capitalists also led it to be unable to perceive differences between work places, which could be classified from smallest to largest, from agricultural to financial to electronic etc. Thus, office workers and factory workers have necessarily been fused into each other because of they have no ownership of means of production, no use of others labour, no control

over other labour, unskilled and surviving by selling their unskilled labour. Similarly, varieties among skilled workers, experts, managers and supervisors which have been generated through sectoral differences have also been misunderstood.

In this context, some clarifications must be identified as my point of departures. First, I have preferred the term of `capitalists' rather than bourgeoisie or employers because of the two reasons. First, formation of bourgeoisie as a social class has no parallelism with formation of `bourg' as an autonomous community in a conflict against feudal-rural or political-military power, in Turkey. They have characteristics of bourgeoisie due just only to they hold capital. In fact, it must also be questioned how much they have autonomous power of bourgeoisie not only against regulations but also against precapitalistic mechanisms of social and economic relations and control. In contrasts, capitalists have largely been flourished on the basis of state interventions; and they have largely be identified with traditionalconservative ideologies. Second, I also reject the term employers because of top level state bureaucracy could not be comprehended under the name of employer although they have larger amounts of employees than most of capital owners.

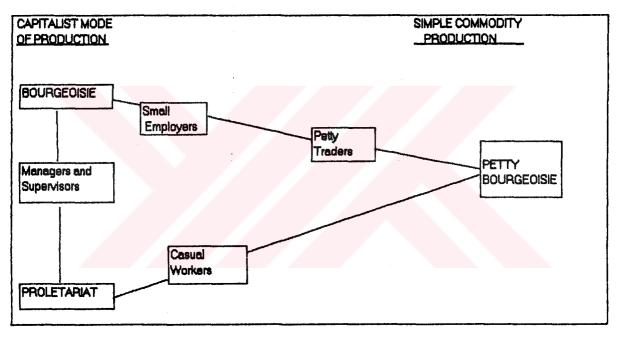

Second, I add to table the categories of petty traders and casual workers as two contradictory locations generating on the basis of intermediary mechanisms of articulation of modes of productions. They are traders and workers who have no permanent work places and regulations. In fact petty traders are not only consists of traders but all other forms of economic activities realized on streets, i.e. informal sector occupants. In contrast to some Marxist comprehension on these persons, I argued that petty traders located in between petty bourgeoisie and small employers. It is not enough for one to be a worker because of he/she has dependent upon to a larger unit i.e. exploited by larger unit through direct or indirect linkages since these linkages are true for any kind of economic activity.

On the other hand, casual workers have located between petty bourgeoisie and unskilled wage workers. They are not comprehended as petty traders and semi-autonomous wage workers because they are not got their money as wages already, such as carriers. They earn their bread by selling their labour but not by selling goods or using means of labour in their private property as in the case of petty traders.

Third, I have identified all employers who have employees less than 10 person as small employers; whereas Wright argues that petty

bourgeois can also use of one other's labour besides his/her own favor, unpaid family workers and apprentices. In this context, I have use ten categories about class locations by using the categories of unskilled wage workers, skilled workers, experts and managers as Wright defines them; as they are indicated in Figure-1.

Figure-1: Basic and Contradictory Class Locations of Present Study

Capital Letters: Basic Class Locations
Small Letters: Contradictory Class Locations

Note: Adopted from E. O. Wright, 1978:63.

# Question of CCL's: Debate on Polarity vs Plurality

Most of the problems for Wright's model have generated from identification of CCL's. It has to decide to which locations are necessary as well as which ones are not. There must also be some quantitative criterion for such a decision which Wright's model has lost; and it has implicitly used qualitative criteria of Marxism as it is reformulated under the concept of exploitation. As it will be further discussed, polarity plurality dualism is one of the very basic stimuli for class debates in general. It is generally comprehended that class formations and historical-social transformation will necessarily be violent and revolutionary if polarity is the basic way of class formation; and vice versa. Also, intermediary class categories will necessarily be absorbed into basic class categories as a necessary precondition for class struggle and revolutionary change. However, most political revolutions, either popular or class based, have been occurred after violent struggles free from whether they have occurred from a society with intermediary categories or not. In contrast, Soviet, Chinese and Cuban revolutions as well as French one can easily evidenced that revolution has occurred through a violence if intermediary class categories have dominance within society. In this context, question of polarity plurality dualism should not attempt to answer the question of

social change but decide to how much and in which form capitalist class society has been realized.

# 1. 5. Unaccounteds: Problem of Unemployed Household Members

In addition to Wright's failure to grasp some very basic social aspects defining individual's locations within class structure; such as income as successfully studied by Goldthorpe et.al. (1968a; 1968b; 1969) class analyses as most of other sociological ones have very fundamental failures. Sociological studies using questionnaires as the basic technique of data collection have a strong dependency on respondents by themselves and dismissed a huge amount of persons out off consideration. They can affect social relations of respondent whom concepts of class locations have been constructed on. Also, they indicate social spheres of class locations within family networks. To add these unaccounted persons in to the picture I have got data on respondents' close social environments which consist of family members and friends.

Family members as they are in household can affect individual's class locations in two basic ways. First, different locations

can be merged into each other; and family's class locations can be different from it's members, particularly head of household's class locations. Second, number and quality of unemployed household members can influence employed household members, i.e. household members who have a class location. This is relatively more important at single employed families. It can be argued that single employed family is typical for Turkish family in which housewives, house-girls, unemployed adult boys and their wives if they are got married stayed in.

### 1. Questions and Research Hypotheses

In this context, this study attempts to illustrate processes and differences about class formation and consequent class structures in relation to social changes in a middle-sized industrial city and the national capital of Turkey. It will also be enable us to evaluate conventional class conceptions with their arguments on class boundaries as they are identified in 10 categories mentioned above. The arguments of polarization and pluralization will also be discussed.

Also, the study looks for social, political and cultural features of basic social classes and class locations to what extent economically defined class categories have been transformed into social class? It will

enable us to evaluate debates on the relationships between social classes' economic foundations and social, cultural, political and ideological aspects of social reality, and so on.

Thus, basic arguments or hypothesis of this dissertation can be summarized as follows:

- 1) The proportion of people belonging to simple commodity mode of production and contradictory class locations is more than the proportion of basic class locations in Turkey; because leading sectors of domestic capitalism does not has much autonomous power to appropriated majority of labor force for its own benefits alone.
- 2) There are relatively more people at contradictory class locations in between simple commodity mode of production and capitalist mode of production in Turkish cities; because Turkish society has been transformed itself from pre-capitalistic forms of productions to capitalistic ones.
- 3) There are relatively less numbers of people at contradictory class locations specific to capitalist mode of production, namely managers, supervisors and experts; because Turkish society

does not have enough success on capitalist organization i.e. centralization and condensation of capitalist relations.

- 4) Cross-class transitions have also high rates in Turkey, because, class boundaries have not clearly been identified as well as class borders have been not strictly closed for others.
- 5) There are less statistically significant differences between basic and contradictory class locations with respect to differences in terms of actions and opinions; due to expansion through contradictory locations rather than basic ones.
- 6) There are high rates of horizontal and vertical mobility i.e possibility of going to top as a result of specific way of formation of urbanization and proletarianization in Turkey.

#### **CHAPTER II**

#### METHOD OF RESEARCH AND PRESENTATION

#### 2. 1. Method of Research

A structured questionnaire has been prepared and deep interviews on limited numbers of respondents have been realized in order to get a relatively valid data base in order to discuss on mentioned questions. Although questionnaire has been constructed based on Wright questionnaires of Comparative Project On Class Structure and Class Consciousness which has been developed in 1982, it is not simply one to one translation from English to Turkish. Akşit's (1971; 1975; 1985) questionnaires and studies on Kırıkkale and Corum, next and more populated urban center at north east of Kırıkkale have also been used for the preparation of documentary sources. Before final survey in Kırıkkale, two previous steps of field study have been carried out. First, communications have been with formal officers and various persons at community; such as provincial governor, the mayor, quarter headmen (muhtars), local journalists etc. Second, most of persons who have recently been communicated visited again with more structured form of questionnaire as well as some other ordinary persons in Kırıkkale. Third, final survey have been realized.

Sample has been selected from lists at local bureau of elections which consists of name and addresses of voters into political elections. Number of persons within sample has also been decided in considering distribution of participants into quarter areas. Respondents have been decided as employed or un-employed persons who looks for an employment opportunity seriously. This criterion turns the sample as the sample of males because there are little number of economically active females. If anybody could be found with such characteristics and one of the eligible neighbors has been selected by researcher or interviewers at the field.

Twelve university students in senior classes from the departments mainly of social sciences have been recruited as interviewers to collect data. They have been trained roughly for 30 days by the researcher at Ankara. Researcher and these students have settled at Kırıkkale for approximately 30 days. Field study have been completed in summer months, july, august 1990. Some of respondents have also been visited by researcher at later dates.

Raw data has been processed on personal computers by using specific data base program, Paradox Release III to entering the data into computer and SPSS for statistical analysis. Coding and entering of raw data into computers took approximately six months; and data cleaning also data modifications have consumed many more months.

Similar procedures have also been carried out for Ankara, 1991, from july to september; whereas sampling procedures were radically different from Kırıkkale. Sample is selected by State Institute of Statistics. Questionnaire used for data collection in Ankara have differences from which those ones used in Kırıkkale; although it enables a comparison possible. Data coding, entering, cleaning, modification and further procedures have relatively lesser times in comparison to Kırıkkale.

# 2. Peculiarities of Two Cities: Kırıkkale and Ankara;

Different paths of articulations of CMP and pre-capitalist modes of productions can generate different social results i.e. class locations and different paths of class formation. For example, establishment of CMP's domination through the expansion of service

jobs under state ownership rather than mercantilism and industrialism under the leadership of private capital generates different results at social arena (Geertz, 1963b and Akşit, 1985b).

In this sense, Kırıkkale is a very special case. It has been constructed under an apparent state intervention into rural area, Kırık village (Yıldırım, 1966; Akşit, 1971; Aslıyüce, 1974; Atalay, 1984); whereas Ankara had already be an urban area for centuries. Kırıkkale located at central Anatolia; surrounded by Ankara, Çankırı, Çorum, Yozgat, Kırşehir. It is located on Ankara-Samsun and Ankara-Kayseri and Erzurum higways and railways. It was originally a village, named Kırık. It has been transformed into an urban area by establishment of a military-industrial factory next to village in 1925. There are seven military industrial units established at several years in City. There are also non-military but governmental large scale industrial units in Kırıkkale established through years after military establishments. Under these influences, village grew rapidly by pulling a huge amount of population from other communities. Later, relatively large scaled (but smaller than governmental units) private establishments have flourished at various sectors of economy.

Kırıkkale is not representing a way of urbanization via rural development of its own hinterland, regionalization. Regionalism, if

exits, is a consequent product of its urbanization under external interventions. In 1940 the rural and urban population was almost equal; but especially after 1960 the urban population of the district began to be more than rural population. According to data from SIS in 1985 total urban population was 208018 but the rural population is only 54331. The proportional weight of urban population was 52.50 % and 79.29 % in 1945 and 1985 for Kırıkkale; and 18.44 % for 1945 and 45.44 % for 1980 for Turkey, respectively. In other words, Kırıkkale is only a center even for its rural hinterland whereas Ankara is a national metropolice with it's disproportionately larger and denser population than Kırıkkale.

In Kırıkkale, although it is an industrial creature of state intervention from above, urban structures have very characteristics of over-urbanization, (Roberts, 1979) which is conceptualized by Akşit under the term of industrial-commercial (1971)characterized by expansion of urban economy through non-industrial sectors rather than industrial jobs. Over-urbanization accepted as the characteristics of 'underdeveloped' countries with the population centered in relatively few urban centered which have high rate of growth (Roberts, 1978) (See Table 2). These cities are viewed as being overpopulated, with high level of unemployment or underemployment. The concentration of jobs is in 'non-productive' activities created by government, in commerce or personal services. These facets are evident especially for Kırıkkale more than Ankara. Recently, both involutionary growth and unemployment are two appearances of same fact that Kırıkkale has largely lost its `pulling' capacity. It has no ability to generate new income opportunities particularly at formal establishments. Thus, urban population has been grew due not only to fertility but due also to continues immigration, probably made in considering high rates of `expected wage' (Todaro, 1969; 1971; Harris and Todaro, 1970).

Kirikkale is an urban area where 60 % of economically active population have been employed in military factories in Kirikkale. However, factories have seen have no further capacity for labor absorption. Although, proportional weight of employed persons by total number of population for Turkey is 24.68 % and 25.69 % for Ankara; it is 22 % for Kirikkale. In other words, household heads in Kirikkale either keep their family members away from work or they are largely unemployed in 1980'es in contrast to early years of foundation of the city.

Unemployment is more obvious when we look at urban areas. Proportional weights of employed population at urban Kırıkkale is 19.92 % whereas it is 31.10 % in Ankara and 29.50 % in Turkey in general in

1980. These employed people consist of 33.84 % of economically active population in Kırıkkale whereas same ratios are 48.70 % for Ankara; and 61.7 % for Turkey in general. Dependency ratio even at urban Kırıkkale (75.30 %) is higher than national percentages (71.81) including also rural areas. Females have composed of only 1.53 % of total employed persons whereas same ratio is 7 % for Ankara.

Table-2: Number and Proportion of Urban Populations in Kırıkkale, Ankara by Five Years

	Population in Kirikkale and Ankara by Years								
Years	Kirikkele	% change	Differences	Ankara	% Change	Differences	Turkey	% change	
		per 5 years	from Turkey		per 5 years	from Turkey		for Turkey	
1935	4599			122720			16158018	18.39

1975	137874	50.42	37.10	1701004	37.60	24.28	40347719	13.32	
1980	178401	29.39	18.51	1877755	10.39	-0.49	44736957	10.86	
1985	208018	16.60	3.35	2235035	19.03	5.78	50664458	13.25	
1990	243378	17.00	5.54	2559471	14.52	3.06	56473035	11.46	

Kırıkkale is a center for industrial labor whereas Ankara is a center for service-office labor. Proportional weight of labor at service sector is 44.78% and 36 % for Ankara and Kırıkkale respectively in 1985. 43 % of employed persons have been employed at industrial units in Kırıkkale.

Kirikkale has younger population than Ankara and Turkey's; 40.8 % of population is younger than 15 years old, whereas proportional weights of elders with more than 60 years old has lesser than national percentages.

Although it is established through an external intervention from above, Kırıkkale is still seen as an unorganized city (Akşit, 1971; Kıray, 1972b). There are 21 neighborhoods which are concentrated around city center which is also shaped around government buildings, named Republican Plaza. In fact, plaza is not a plaza, but a relatively better constructed street. Plaza is far away from factories and other large scale work places. It is a kind of housing and comsumptional marketing center. Transportational and large scale commercial networks are established at peripheries of city which is separated from center by also housing areas. Some of these housing areas are in fact old rural villages which have been joined into city because of demographic expansion.

In sum, Kırıkkale is an urban area representing urbanization by state intervention from above whereas Ankara has much more dependent upon its rural and urban hinterland. Ankara is more urbanized if we define urbanization with respect to size and density of population; (Park, et al., 1925) whereas Kırıkkale is more urbanized if we define urbanization by industrialization i.e. increase in number of industrial labour force (Castells, 1976).

### 2. 3. Sample

Sample has be captured within general title of area sampling by considering such a segregated spatial organization of Kırıkkale. There are two basic groups of neighborhoods, namely old and new, either established as joined villages or new settlements for newcomers which could have totally different populations. Thus, 425 persons have been selected from 21 quarters in Kırıkkale, as it is illustrated below.

On the other hand, it has relatively more difficulty to select a representative sample from Ankara with its total population approximately three millions. Same method of area sampling as it is operationalized in Kırıkkale have no feasibility for Ankara. Thus, sample have been selected by SIS, by considering income levels and occupational statuses of urban population by breakening down over urban quarters also. Thus, 479

respondents have been selected from different quarters of urban Ankara, as they are indicated in the following table.

# 2. 4. Method of Presentation: Plan of Dissertation

Report plan has composed of seven main chapter including introduction and conclusion. Theoretical evaluations are largely been presented in introduction. However, some further comprehension about class formations, and particular characteristics of social change and urbanization, politics and religion in Turkey have been presented in chapters, numbered as (4), (5), (5.1.1.), (5.2.3.3.) and (6.2), respectively.

#### CHAPTER III

### BASIC AND CONTRADICTORY LOCATIONS IN KIRIKKALE AND ANKARA

#### 3. 1. BCL's and CCL's in Cases

# 3. 1. 1. Basic and Contradictory Locations of the Respondents

As it has already been pointed out that Wright has been comprehended as an attempt on generating structured means of data collection and processing for class analysis where social classes have been identified in accordance to Marxist categories. Also, following informal sector discussion, I added to Wright's model the categories of petty traders and casual workers in which they have been conceptualized as contradictory class locations (CCL's) in between SCMP and CMP; that is, in between proletariat and petty bourgeoisie. On the other hand, I have left out some of Wright CCL'S, which corresponds to internal diversifications of experts within themselves as they are particular consequences of large scale capitalist firms i.e

center of capitalist monopolies. I have to put an end on proliferation on to categorization into details, although further elaboration is also available on the basis of Marxist debates.

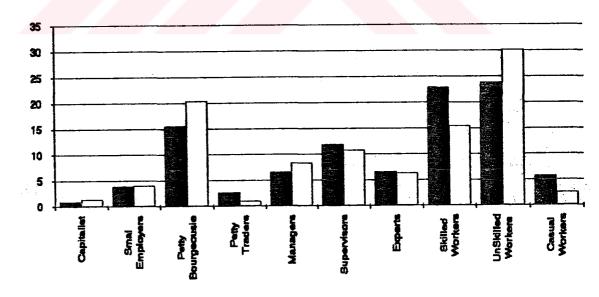

In this context, following Wright, I have constructed 10 categories of class locations on the basis of 21 items which give information about respondents' location on 1) exploitation, 2) ownership of means of production, 3) use and control of others labor. In Wright model there are three basic classes at capitalist social formations namely, capitalists, proletariat and petty bourgeoisie. In present study, as already been discussed at section on 'polarity vs plurality,' proletariat have been diversified within itself into further units, namely unskilled workers, skilled workers, casual workers, experts, supervisors and managers. In fact, casual workers can also be seen as a contradictory locations between petty bourgeoisie and proletariat. On the other hand, small employers have been identified as an contradictory location within capitalists themselves whereas petty traders appeared in between petty bourgeoisie and proletariat. I will use each of these locations in order to comprehend class composition in Kırıkkale and Ankara.

In this context, it must also be pointed out that formal school degrees have not been considered as a determinant for laborers'

Table-5: Numbers and Proportions of Class Locations in Kırıkkale and Ankara

Class	Kirikkale		Ankara		
Locations	N	%	N	%	
Capitalist	4	0.9	6	1.3	
Smal Employers	16	3.8	19	4	
Petty Bourgeousie	68	15.5	97	20.3	
Petty Traders	11	2.6	5	1	
Managers	28	8.6	40	8.3	
Supervisors	50	11.8	52	10.8	
Experts	28	6.6	30	6.3	
Skilled Workers	97	22.8	74	15.4	
UnSkilled Workers	101	23.8	144	30.1	
Casual Workers	24	5.6	12	2.5	
Total	425	100	479	100	

Graph-1: Numbers and Proportions of Class Locations in Kırıkkale and Ankara

locations to comprehend assets in scarce skills/ talent. Managers and supervisors have been identified with respect to their degree in control of others labors; experts have been identified if they have any vocational training and skilled workers have been identified if they have any skill. There are managers, supervisors, experts and skill workers with lower degrees of education than the degrees of education advised by Wright (1985:149-153).

First question is whether the communities in discussion are class societies or not; whereas second one is, which class locations are dominant in these communities. These questions necessarily answer the question of social change i.e. how much capitalist mode of production get success in its dominance over others. Kırıkkale is a city of proletariat. Number of persons who belong to this basic class locations of capitalist mode of production, as it is defined as sum of skilled and unskilled workers (46.6 %) and capitalist (0.9) have made of 47.5 % of total population. Also largest group directly belongs to skilled workers in city. Contradictory locations indicating a high rate in establishment of capitalist mode of production have also considerable proportion in community, with proportional rate of managers, supervisors and experts at 25 %. However, small commodity mode of production has a negligible portion in class structure with 15.5 % of petty bourgeoisie. Petty bourgeoisie has second largest group in the city. Also, small employer, casual workers and petty traders, as contradictory locations between modes of production have some which attached a transitional characteristics of city with their proportional percentages of 12 %. (See table 5)

Ankara, on the other hand, is a city of unskilled workers who have made of largest group in Ankara. They are largely been employed at service sector at public spheres in contrast to Kırıkkale where skilled worker have largely been employed at large scale units scale manufacturing establishments. industrial small Proportional weight of skilled workers have lesser than unskilled one in Ankara and vice versa. Also, petty bourgeoisie has shared second portion of population in Ankara. Interestingly, they have more weight in class structures than they have in Kırıkkale. However, Ankara has a more established pattern of class structure if we look at weight of contradictory locations between modes of production. Their proportion in total population is only 7.5 %, approximately two times less than Kırıkkale. In this context, Kırıkkale seems to have proportionally more weights of pre-capitalistic or pro-capitalistic (Keyder, 1981) forms whereas Ankara have more capitalistic forms. On the other hand, contradictory locations within capitalist mode of production itself have shares of 47.76 % in Kırıkkale and 40.91% in Ankara. This enabled us to argue, in contrast to former one, that Kırıkkale has more developed forms of capitalist organization whereas Ankara have less developed forms. However, if skilled workers have been excluded from contradictory locations, proportional weights of same contradictory locations make such an argument to declare Ankara to have more capitalistic forms than Kırıkkale with their proportional weights of 24.94% in Kırıkkale and 25.46 % in Ankara.

Also, it must be remembered that contradictory locations specific to CMP have largely been generated on the basis of clientalism in large scale public firms rather than specializations necessary for work efficiently. Disproportionately higher number of employees are being employed at public firms rather than private ones in both cities; although Ankara has little more labour at private ones (See table-6).

Table-6: Proportions of Labour at Private and Public Firms.

	Kırıkkale %	Ankara %
Public Firms	72.2	62
Private Firms	27.8	38
Total	100	100

It must also be noted that it is questionable how much Ankara has more established patterns of social classes than Kırıkkale, as it will be further analyzed with respect to data on USA and Sweden, because a coefficiency calculated on shift sharing technique have indicate a few of differences between two cases (Wright, 1985:195-211).

Table-7: Shift-Shares between Ankara and Kırıkkale

Class Locations	Differences
	Ankara-Kırıkkale
Capitalist	- 0.4
Small Employers	- 0.2
Petty Bourgeoisie	- 4.8
Petty Traders	+ 1.8
Managers	- 1.8
Supervisors	+ 0.9
Experts	+ 0.3
Skilled Wage Workers	+ 7.4
Unskilled Wage Workers	- 6.3
Casual workers	+ 3.1

Average

Table-7 shows that there is a differences in between two cities with only 0.2 % although two cities have seemed to be totally different on the basis of their size, density, and patterns of work.

0.2

However, shift-share coefficients have more importance if they are comprehended as indicators of proportional weights of class locations within community. On this basis, Kırıkkale is a city of factory and Ankara is a city of offices with their largest locations of skilled and unskilled (i.e. salaried) wage workers. As it will be further discussed at the section on polarity vs plurality, people belonging to basic class locations of capitalist and small commodity modes of production in Kırıkkale have less number than Ankara, except skilled wage workers. This also means that 'entrepreneurial dynamics' of population in Kırıkkale has been less developed than Ankara which is further evidenced by less of people belong to small employers and petty bourgeoisie in Kırıkkale. Their entrepreneurial capacity have largely expanded towards petty trading instead of petty work; as it is called 'commercial-manufactural involution' by Akşit (1985: 133-139). In this contexts, as it will be further evidenced in section on comparison with Sweden and USA, Ankara has more maturated forms of capitalism than Kırıkkale.

Also, what presented data has evidenced is that both cities have very characteristics of capitalist class society rather than non-capitalist one. But, conventional class analysis have necessarily excludes a huge amounts of population who have no labor realized on

market mechanisms. Needles to say, their weights have necessarily been considered in any sociological analysis.

## 3. 2. Un-accounteds: Basic and Contradictory Class Locations of Household Members

Proportional weights of class locations have also a similar distribution if their proportions have been calculated by considering family members. Respondents have consisted of only 19.26 % and 25.04 % of total population (respondents plus their household members) in Kırıkkale and Ankara respectively. In other words, 80.74 % and 74.96% of people have not been directly accounted although they have closely joined into the studied class locations. If we consider only persons with age grater than 11, proportional weight of unaccounted people have decreased by 6.1 points to 74.64 % in Kırıkkale and by 5.28 points to 69.68 % in Ankara. In any case, there are more than 50 % of population who are unaccounted in both cities. And these unaccounted populations can have significant influences on respondents' actions at different spheres of life in a similar way of their linkages with rural backgrounds.

There could be two basic causes of influences, generated from quantity and quality of unaccounted members. First, family have

a different locations at class structure from each of its members class locations. This way is only possible if families have members with different employment conditions (Wright, 1987). In these conditions, various locations can be merged into each other within family. This merge can influence members life conditions positively or negatively. University students and housewives either who earn nothing or lesser money than his partner (i.e. spend more than she earn) are examples of positive influences. Unpaid family workers and wage earners who gave his money into his/her partners are relatively best examples of negative influences. Second way is generally observed in the cases of 'one-employed family.' In these cases there are two theoretical alternatives for others' i.e unemployed: 1) being an unpaid family worker; 2) being a guarantee insurance for further family expectations. However, either in the case of guarantee or slaves, they are dependent upon employed household members.

As it will be discussed into its details at further sections, it is necessary looking at unemployed partners' (composed largely of females in both cities) and children's position within household relation or family works to answer whether unemployed (i.e. unaccounted by class analysis) family members are slave, serf or guarantee. One of the basic indicators for such a discussion can be inferred from evidence on dependency ratios. If we redefine

dependency ratio as number of persons (including employed and unemployed) for each employed person; average numbers are 3.51 and 2.58 for Kirikkale and Ankara, respectively. That is to say 3.51 persons, including bread earner who shares what bread earner can bring in Kirikkale (See Table-8).

In other words, proportional weight of dependent persons are disproportionately higher in Kırıkkale than Ankara. This may be one of the basic reason influencing human actions at different spheres of life which is very characteristics for Kırıkkale. In this context, question is whether there is any significant differences among class location with respect to dependency ratios. Experts have an exceptional characteristics with its ratio of 2.83 which is 0.68 point lesser than average in Kırıkkale where petty traders have highest value of dependency ratio. Ankara has also a similar table where experts have lowest value and petty traders have highest value of dependency ratios. Dependency is very basic characteristics of females as it is evidenced by employment ratios of female (See Table-8).

Among respondents, there are only 23 females (5.4 % of respondents) who have got regular employment opportunity in Kırıkkale and 103 employed females (21.5 % of respondents) in Ankara. Same ratios of females who have a regular employment 8.4 %

and 28 % among total numbers of family members who have aged grater than 12 years old in Kırıkkale and Ankara, respectively. They have been appropriated as either house wives and house girls i.e. potential house wives in both cities.

Table-8: Employment Conditions of Household Members by Class Locations

	Employment Conditions among Family Members							
	Kirikkale	Kirikkale			Ankara			
	Employed	Household	(2)/(1)	Employed	Household	(2)/(1)		
	and Retired(1)	Members(2)		and Retired(1)	Members(2)			
Capitalists	5	25	5.00	8	25	3.13		
Small Employers	29	93	3.21	31	69	2.23		
Petty Bourgeoisie	104	350	3.37	148	396	2.69		
Petty Traders	14	74	5.29	5	20	4.00		
Managers	41	138	3.37	63	150	2.38		
Supervisors	77	270	3.51	80	211	2.64		
Experts	42	119	2.83	51	93	1.82		
Skilled Workers	140	481	3.44	. 117	308	2.63		
UnSkilled Workers	144	534	3.71	215	581	2.70		
Casual Workers	33	121	3.67	23	57	2.48		
Total	629	2205	3.51	741	1912	2.56		

Have these unaccounted household members can be evidence of the assumption of pre-capitalist society for Kırıkkale and Ankara? In my opinion, unaccounted household members have necessarily generated outcomes of conventional class analysis which have no room to grasp labor staying out of market and related production.

#### 3. Comparison with Sweden and USA

Differences between Kırıkkale and Ankara with respect to establishment of capitalist mode of production have got more visibility if class compositions of both cities have been compared to class compositions of western-developed capitalists societies. I will use data on USA and Sweden. I have recalculate average scores by adding shift-share scores on petty traders and casual workers which have no place in available data on USA and Sweden (Wright, 1985: 195-211). Thus, average-1 compares class locations considered within 'ideal typical' of capitalist social formation by Wright which are also available in Kırıkkale and Ankara as well as USA and Sweden whereas average-2 compares class compositions in which other categories have also taken place within themselves as they are in concrete reality.

Comparison between Turkish cities and USA and Sweden has to be made in two levels, namely class locations belong to ideal typical of capitalist social formation and concrete forms of articulation. (See table-9) In this sense, differences between Kırıkkale, Ankara and western societies are lesser at level of class locations belonging to ideal typical of articulations of modes of production than the differences at level of concrete social formation. Also, differences between Kırıkkale

and western societies have more visibility than their comparison with Ankara.

Table-9: Shift-Shares between USA, Sweden, Ankara and Kırıkkale

	Differences			
	USA - Kirikkale	USA-Ankara	Sweeden-Kirikkale	Sweeden-Ankara
Capitalist	-0.9	-0.5	0.2	0.6
Small Employers	-2.2	-2.0	-1.0	-0.8
Petty Bourgeoisie	8.6	13.4	10.1	14.9
Managers	-5.8	-4.0	-4.3	-2.5
Supervisors	-5.6	-6.5	1.7	0.8
Experts	3.2	2.9	-0.2	-0.5
Skilled Workers	10.6	3.2	5.0	-2.4
Unskilled Workers	-16.1	<del>-9</del> .8	-19.7	-13.4
AVARAGE-1	<u>8.2</u>	3.3	8.4	3.3
Petty Traders	2.6	1.0	2.6	1.0
Casual Workers	5.6	2.5	5.6	2.5
AVARAGE-2	16.4	6.8	16.6	6.8

However, both Kırıkkale and Ankara have basic characteristics of newly developing capitalist society as evidenced not only on expansion of labour market through petty trade and casual works but also as an expansion on petty bourgeoisie which have lesser number and proportions in Sweden and USA. Also, unskilled workers, managers and Supervisors have disproportionately smaller numbers in both cities than Sweden and USA.

These data identify not only of some characteristics of a newly developing capitalist social formation but also rate of differences between Kırıkkale and Ankara. Kırıkkale has more characteristics of precapitalistic relations as Ankara has more capitalistic ones.

### 3. 4. Some Remarks on Polarity vs Plurality

Question of plurality and polarity is one of very basic impulse for class analysis. Any arguments on polarity plurality duality reflects a hidden assumption on the way of class formation and the role of social classes in social transformation. Arguing on polarity as the way of class formations necessarily lead to another argument on necessity of class struggle and violent revolutionary changes for historical-social transformation. In this process, one of the social class is also necessarily becoming leading force of this changes as well as one of them will necessarily be hostile for this growth as a regressive actor. On the other hand, any argument on the existence of intermediary class categories between basic or fundamental class locations, feels itself, free from its argument on peaceful transition from historical stages of growth, as oblige to explain how it conceptualizes the role of fundamental and intermediary class categories in social changes.

Any evaluations on tendencies of polarity and plurality have to look at cross-class mobilities, which could be seen as cross class changes between parent's and children's class locations and between respondents first and last class location, as it will be further discussed in sections on inter and intra generational mobilities. Also, it must be necessary to look at whether petty bourgeoisie, petty traders, and small employers, i.e. 'middle classes' have lost their own work or not. However, I think it is also necessary to have a look at cases as if arguments of polarity or plurality are valid not only in order to decide on whether tendencies of polarism and pluralism have existence; but also to decide on how much and in which composition capitalist class society where capitalist mode of production have been achieved. In other words, question is whether middle classes have been flourished or not.

In this context, class structures in Kırıkkale and Ankara through which narrowed and expanded forms as in section 1.4. in introduction, have been given as in Table-5. On this table, basic class locations can be defined in two ways. First they can be defined as sum of capitalists, unskilled workers which have 24.7 % and 31.4 % of total population with respect to their narrowest identifications in Kırıkkale and Ankara. Second, they can be defined as sum of capitalist, unskilled workers and petty bourgeoisie in which they have 40.2 % and 51.7 %

of total population with their narrowest identification in Kırıkkale and Ankara, respectively. On the other hand, proportional weights of basic class locations by first and second ways of expanded definitions are 51.3 % and 69.4 % for Kırıkkale and 50.8 % and 72.1 % for Ankara, respectively if we added nearest locations to categories of capitalists, petty bourgeoisie and unskilled workers, in which they are small employers, petty traders and skilled workers.

Table-10: Numbers and Proportions of BCL's and CCL's in their Narrowed and Expanded Identifications

	Proportion of C	lass Locations		
	Kirikkale		Ankara	
	N	%	N	%
Capitalists				
Capitalists	4	0.9	8	1.3
Capitalists-1	20	4.7	25	5.3
Capitalists-2	86	20.2	122	25.6
Capitalists-3	97	22.8	127	26.6
Middle Classes				
Petty Bourgeoisie	66	15.5	97	20.3
Petty Bourgeoisie-1	77	18.1	102	21.3
Petty Bourgeoisie-2	105	24.7	142	29.7
Petty Bourgeoisie-3	155	36.5	194	40.6
Petty Bourgeoisie-4	183	43.1	224	46.9
Petty Bourgeoisie-5	199	46.9	243	50.9
Petty Bourgeoisie-6	296	69.7	317	66.3
Working Class				<del></del>
Working Class	101	23.8	144	30.1
Working Class-1	198	46.6	218	45.5
Working Class-2	226	53.2	248	51.6
Working Class-3	276	65.0	300	62.6
Working Class-4	304	71.6	340	70.9
Working Class-5	326	77.2	352	73.4

Capitalists have 22.8 % and 26.6% whereas proletariat have 77.2 % and 73.2 % of total population in Kırıkkale and Ankara respectively; if capitalists and proletariat have been defined with their most expanded forms. (See table 10) On the other hand, middle classes have also shares 15.5 % and 20.3 % of total population if they have been identified as sum of petty bourgeoisie alone. Also, they have shared 21.9 % and 25.3 % of total population if they can be identified 'traditional petty bourgeoisie' of Poulantzas, (1977; 1983) generating either as residuals or indicators of 'commercial and industrial involution' of Akşit (1985) as sum of petty bourgeoisie, petty traders and small employers in Kırıkkale and Ankara, respectively. Third, middle classes consists of 46.9 % and 50.9% of total population in both cities if we add proportional weights of managers, supervisors and experts as core of `new petty bourgeoisie.' Fourth, middle classes have arrived the ranges of 69.7 % and 66.3 % of total population in Kırıkkale and Ankara, respectively; by adding skilled workers into the calculation by assuming skilled workers have began to be isolated from pure form of proletariat.

These evidences about class locations have again pointed out class formation has been achieved enough to label communities as capitalist; and classes grows in a plural mode in both cities where middle classes have largely been diversified new fields of work.

#### **CHAPTER IV**

# IDENTIFICATION OF SOCIAL CLASSES THROUGH CLASSIFICATORY VARIABLES

#### 4. 1. Feminity vs Masculinity?

It will be pointed out that Kırıkkale and Ankara has different proportions of females at labor market where Kırıkkale has four times lesser number of female occupants within total occupants; although females have composed of only 21.5 % of total employed persons in Ankara. (See table-11) Question is not sexual division of labour in relation of production; but females' exclusion from labour market, i.e. sexual segregation at level of social formation.

In Kırıkkale, there are no female occupants among capitalists, petty traders and casual workers; whereas there are females in all locations in Ankara, except capitalists. On the other hand, experts have disproportionally largest amounts of female occupants in Kırıkkale. And, unskilled workers have largest groups of employed female in

Ankara where second group is skilled workers and third one petty bourgeoisie. All other locations have successfully be hold by males. This has also influences on class formation and social relations. Both processes of class and 'community' formations are largely realized among males at public spheres in which females are excluded. Females are necessarily closed into their 'homes,' and neighborhood and family networks. This will be strengthening controversy among males and females although such a controversy has successfully be covered by which females are largely been excluded from labour market until now.

Table-11: Numbers and Proportions of Sexes of Respondents by Class Locations

	Sex of F	lespond	lents										
	Kirikkalı	•					Ankara						
	Female		Male		Total		Female		Male		Total		
	N	%	N	%	N	%	N	%	N	%	N	%

	Chi Squ	ore = 3	6.77415		DF = 9		Chi Sq	uare = 2	20.60254 DF = 9				
	Signific	ance - (	0.00003		P < 0.001		Signific	cance - 0	.01454		P < 0.05		

Sexual distribution of family members has also a similar picture with sex distribution of respondents (See table-12). Kırıkkale is a male community in which female has relatively smaller proportional weight than Ankara, where females have more than fifty % of total population. Although there is no significant differences among class locations concerning their members' sex, supervisors, casual workers have more proportional weights of females within themselves; whereas capitalists, unskilled workers and small employers have relatively smaller numbers. Experts and petty traders have a balance between male and female in themselves in their families.

One of the probable causes of such a distribution for Kırıkkale can be founded on action on marriages. Capitalists, small employers and unskilled workers could probably get married their daughters at smaller ages, whereas supervisors, managers and casual workers have not such a success. Similarly, capitalists, small employers and casual workers can have failure to get married for their young boys; or they are able to survive their young boys for longer times. Thus, married girls go out of Kırıkkale; whereas boys have been continuing to stay with their parents with or without a regular income; and married or not.

#### 4. 2. Younger vs Elder?

Age structures as a second structural indicator shows that 53 % and 48 % of total population are younger than 25 years old in Kırıkkale and Ankara, respectively (See table 14). Therefore, question of employment is not only a question for un-employed persons who have been dismissed from labour market but also a question for youth to enter into labour market. Old generations either can successfully provide employment opportunities for their younger generations and then realized social transformation, reproduction or society will be disintegrated.

Younger occupants, if we define youth with ages below 30 years old, have been largely intending towards occupations within the spheres of petty bourgeoisie, small employers, and experts in Kırıkkale; and experts and unskilled workers in Ankara. In other words, younger generations have largely been intending towards private entrepreneurship in Kırıkkale whereas they are intending towards public ones in Ankara (See Table-13).

In this context, as it is for gender segregation mentioned at above section, significance of segregation between elders and youths is probably higher than the segregation of class locations; because all locations have similar proportional weights of age groups. On the other hand, Kırıkkale has more numbers of elders than Ankara who are necessarily excluded from class analysis, if we define them as persons with ages 59 and above. In fact, youths have not been accounted by class analysis because that are also unemployed. Therefore, it is necessary to look at age structures of family members in order to see influences of youths and elders on class locations.

Table-14 indicates that petty traders, managers and casual workers have larger amounts of elder relatives in their houses in Kırıkkale; whereas petty traders and casual workers have also more numbers of kids under the same roof. Age structure skewed into young and old sides in Kırıkkale whereas it is a little bit accelerating into the middle age group in Ankara. In other words, petty traders and casual workers have largely been suppressed by their elder and younger generations in Kırıkkale. They have to pay for their elders' health caring, because most of them, have no insurance of health services as well as they have to pay also for their young children.

#### 4. 3. Married vs Non-Married?

Marriage is seen as compulsory of survival in both cities (See table-15) There is almost no places for unmarried persons. increase in number of married persons should be comprehended as a reflection of unavailability of sexual satisfaction other than marriages in both cities. Segregation between married and unmarried persons have expanded over class segregation in both cities. However, capitalists seen to be escape from these limitations in both cases. Experts in Kırıkkale and supervisors in Ankara have a considerable number of unmarried members. As it is pointed out in table-15, more than 89 % and 94 % of respondents have been married, widowed or divorced in Kırıkkale and Ankara, respectively. Their ways of marriages represents also traditional patterns of marriages in Turkey because they are relatively older than their children i.e. present generations. This analysis will also enable us to do some remarks on question on whether sunnite islam has represents traditional cultural patterns in Turkey or not.

Such a segregation between married and other has also pressed over heads of households. They have to make their children be married because they had also been married by their parents. There are at least two basic way of engagement, wedding and marriage in

Turkey, namely 'gōrücü usulü' -blindfold style- (without no prerelations between groom and bride; but by decisions of parent) and
'tanışarak' (with flirt or a similar kind of friendship between candidate
partners), and religious way which is largely identified on wedding
ceremonies in which Kur'an has been read for community but no
enjoyment has realized. These differences in action have generally
been considered as indicators of modernization by which 'görücü
usulü' represents traditional way of action whereas flirt represents
modern way. Both 'görücü usulü' and religious way of marriages have
been established in accordance with parents' decisions rather than
grooms and brides's preferences; although 'gōrücü usulü' does not
necessarily mean that to be religious-islamic one. Decision on
marriages can be got in accordance to 'gōrücü usulü' but marriage and
other ceremonies can be non-religious in any where in Turkey.

As it is illustrated at Table-16, there is no body who have got married in accordance to religious patterns in Kırıkkale whereas only 0.9 % of total population have got religious marriages in Ankara. 'Görücü usulü' is major way of marriages in Kırıkkale and Ankara; although Kırıkkale has a little bit higher points. On the other hand, approximately more than 16 % and 32 % of persons have declared that they made their marriages by flirt in Kırıkkale and Ankara, respectively.

In other words, Kırıkkale has two time less amounts of people who can get marriages in accordance to their own and partners' free will.

In Kirikkale, experts have seen as the locations with more amount of persons who got marriages by flirt. But they have only one members at this category. Capitalists are the second and petty bourgeoisie is third largest locations with members who have got marriages by flirt. However, no locations have such members more than half. On the other side, there are two locations with persons who have got marriages by flirt as more than their fifty in Ankara where namely experts, managers, supervisors, and small employers.

usulü' in both cities. But it has disproportionately high weight in Kırıkkale although becomes diminishing into 65 percents in Ankara. Basic groups who got marriages in this way are belong to the locations of skilled workers, small employers and petty traders in Kırıkkale and belong to petty traders, (with their five persons) casual workers, capitalists, skilled workers and petty bourgeoisie in Ankara. On the other hand, members of class locations have different aspirations about their children's marriages than their past ceremonies.

On the other hand, social pressure is not only towards to mary their children but also to find necessary condition, i.e. employment. Extended and shrinking families are probably two consequences of these pressures over parents. New members have been added into family when unemployed children have married. Then, domestic spaces for person necessarily be diminished.

#### 4. 4. Illiterated vs Educated Intellectuals?

Education will be considered as fourth structural-classificatory variable of class locations. Table-17 shows that Kırıkkale is less educated than Ankara. Proportional rate of people with secondary school and higher level diploma is only 42.1 % in Kırıkkale whereas it is 51.2 % for Ankara. University graduates have also three times less weight in Kırıkkale. On the other hand, there is also an established correspondence in Kırıkkale and Ankara in the sense of relations between class locations and educational level. These correspondences have been achieved because most of the people have only primary school diploma in both cities. Also, most of managers have grade of lycee; whereas most of the experts have diploma of vocational schools, especially in Kırıkkale. Also, university graduates largely belong to experts in Kırıkkale whereas they belong to managers in Ankara.

												· · · ·						

Managers and supervisors are generally lycee or vocational school graduate in Kırıkkale. They have the power of managing and supervising experts, skilled and unskilled workers with university graduation although they have lesser degrees of education.

Table-17 also proofs that education has not been restricted for some social classes. Agglomeration through primary and secondary school largely shows small kids. That is, education is a way of cross class transmission rather than class formation. Levels of education for household members makes educational differences much more clear, as indicated in Table-18.

Table-18: Numbers and Proportions of Household Members by Levels of Education within Class Locations.

#### 4. 5. Poor vs Rich?

I will define concepts of poverty and richness on the basis of income and consumption. Also, income has been accounted considering main income of respondents, their supplementary sources of income, and house ownership. Thus, ownership of means production which have been considered at construction of class locations have not been considered again. On the other hand, consumption has basically been identified on the basis of building and living standards rather than daily consumption.

#### 4. 5. 1. Main Income

Income has not been constructed as regular or irregular income of respondents alone. It has been accounted as total income, consisting of incomes from respondent's, partner's and other household members' primary and secondary jobs; also supplementary income in cash from other sources. In my opinion, question of income inequality which has a dominance at discussion in literature has no theoretical room at this study. Income inequality has a significance if only stratificatory class model has been possessed, which has, in fact, not been used here. For Marxist understanding of history, income inequality is a natural consequence of economic relations based on

private property and CMP. Thus, the question is simply how much each class have earned. It can be argued that locations belong to CMP can have more earnings than locations belong to SCMP. Also, sources of income will be much more modern-urbanized for locations of capitalism as they are rural for others.

In this context, income diversification in Kırıkkale has shaped in between ranges of minimum 120 000 TL and maximum 12 500 000 TL, with mean 1 416 000 TL, median 850 000 TL, mode 600 000 TL, and standard deviation 1556.988. Same values are as follows for Ankara: minimum:150 000 TL, maximum:520 000 000 TL, mean: 4 843 000 TL, median: 1 988 000 TL, mode: 1 500 000 TL, standard deviation 25360.266 (See table-19). In other words, income inequality, if there is any, is less visible on Kırıkkale in contrast to Ankara. In order to make income differences more visible, seven income groups have been constructed in which ranges of intervals have been decided in accordance with mode value; based to income diversification illustrated at table-20.

Table-19 and its graph shows proportional rates of population and income per each income group as they are defined at table-20 in Kırıkkale. Lowest income group has only share 6.88 % of total income whereas they made of 22.33 % of total population; although highest

income group has share 28.73 % of total income whereas they have made only of 6.80 % of population in Kırıkkale. Income inequality is more visible in Ankara. 33.61 % of population have only 6.43 % of total income in Ankara whereas 5.53 % of population have got 52.98 % of total income.

Table-19 shows some correspondences between locations and income groups. Petty bourgeoisie, experts and unskilled workers, supervisors, skilled workers and managers has a little bit normal curve of income distribution within themselves, respectively. They have members from poorest and richest income groups. Managers and skilled workers have a curve which has largely been skewed toward lower income groups in Kırıkkale. However, poorest groups are largely made of petty traders and casual workers. Petty traders and casual workers have any member with money more than 1 799 000 TL and 2 399 000 TL, respectively. Their poverty is more visible in Ankara where petty traders have members of only two lowest income groups, whereas casual workers have members from tree lowest ones. Also experts and skilled workers have no member at highest income group in Ankara; whereas unskilled workers have. It should also be pointed out that more members of experts, skilled and unskilled class locations have been stayed at lowest two groups of income in Ankara; whereas

capitalist, small employers, and managers have no such members. (See table-21)

# 4. 5. 2. Supplementary Sources of Income

There are two basic ways to get supplementary sources of income theoretically. That is, to work on a secondary job and to get rants. These two ways can also be considered as indicators of social dynamics for economic development. If number of people occupying a secondary job as supplementary sources of income have increased,

social dynamics will also be increased and vice versa. Conceptualizations of persons who get a secondary job either as entrepreneurs or exploited workers at informal activities have no relation with level of their dynamics. They are more dynamic than rentiers in any case. There are 37 persons in Kırıkkale and 47 persons in Ankara who have a secondary job who composed 8.9 % and 10 % of total populations.

On the other hand, there are 160 property owners, i.e. rentiers who have made of 37.67 % of total population in Kırıkkale, also there are only 64 persons (13.4 %) with supplementary sources of income in Ankara. Thirty-one persons have two supplementary sources; and 5 persons have three sources of supplementary income in Kirikkale. There are 14 persons and 5 persons who have two and three additional sources of income in Ankara, respectively (See table-22). Total number of sources and their distribution was shown in Table-22. Most of these rentiers get their income from land in village in Kırıkkale; whereas they have houses in rent in Ankara.

Also a large amount of rentiers have got supplementary sources of income from their parent families in both cities. Petty bourgeoisie and unskilled workers are major groups who have supplementary sources of income in rant in both cities. Skilled workers and supervisors have also considerable supplementary sources of income in Kırıkkale and Ankara. However, it is difficult to argue that class locations have totally different from each other, if we take supplementary sources of income as criterion, except petty traders with only one single members in Kırıkkale with a supplementary source of income. Therefore, it seems to me, as it is at most of the other cases, any locations have their own internal diversifications as owners and non-owners of supplementary sources of income.

## 4. 5. 3. House Ownership: House Owners vs Tenants

In Kırıkkale, (See table-23) there are no significant differences between class locations with respect to house ownership, except petty traders and experts in Kırıkkale with small employers and supervisors in Ankara. Most of the people have stayed on their own homes. Only 21 % and 29.8 % of total respondents have stayed as tenant in Kırıkkale and Ankara, respectively. There are two extreme cases as un-skilled workers and petty traders in Kırıkkale and capitalists

and experts for Ankara. Eighty two percent of unskilled workers has their own houses at Kırıkkale, and only 45.5 percent of petty traders have their own dwelling. In Ankara, 100 percent of capitalists have their own houses and only 37.9 percent of experts have their houses.

In this situation, there is no need for struggle with each other in order to hold public estate for most of population. Thus, there is no social basis of 'housing class' and consequent ethnic segregation because, there is no pre-constructed public estates. However, there can be a struggle to hold public land as own private property by illegal ways. Squatting (Gecekondulaşma) is commonly used way of such formation.

On the other hand, person with more than one houses, whom largely belonged to locations of petty traders, casual un-skilled and skilled workers, supervisors and experts as well as petty bourgeoisie and petty traders in Kırıkkale can also be 'rentiers' who have economic benefits by urbanization. As the urbanization grow; house prices will also grow. Also, not only house owners becomes more 'affluent' but also it becomes more expensive to live in city who have no houses i.e. newcomers, if further squatting has been obscured by governors. Thus, everyone has an advantage just only by occupying

their territory. This may be one of the reason for strengthening of identity of ethnic locality rather than of class.

Most common type of houses is independent houses in Kırıkkale whereas it is apartment flats and squatters in Ankara (See at table-24). Kırıkkale has very limited numbers of squatters (11.7 % of total houses); but most of the class locations have some squatter dwellers, except capitalist, small employers and experts. Petty traders are the major group who use squatting in order to meet their need for accommodation. Petty traders, casual workers and un-skilled workers are major groups of squatter dweller in Kırıkkale.

Urban dwellers of both cities would like to stay at their own accommodation, free from quality of houses considering building and furniture. House ownership has seen as an end by itself for urban Turks.

#### 4. 5. 3. 1. Values of Rent for Accommodation

First, it should be pointed out that range in between lowest and highest rents is significantly lower in Kırıkkale than Ankara. This also shows two realities. First, rent is not a regular supplement of income for house owners; and second, class differences have no correspondence with territorial divisions through urban quarters. But, differences among class locations have also been obviously significant when possible rent values of already stayed houses.

As it is indicated at table-25 capitalists have stayed at houses with highest rent values in both cities. Second and third groups have occupied by small employers in both cities also. However, small employers have stayed at second rank in Kırıkkale whereas they stay at third one in Ankara, although managers have stayed at third rank in Kırıkkale and second one in Ankara. Lowest rent groups are petty traders, casual workers and interestingly supervisors in Kırıkkale whereas they are casual workers, unskilled workers and skilled workers in Ankara. In other words, in Kırıkkale, as a middle sized city, petty traders, casual workers and supervisors have been comprehended, by following Akşit, (1975) leading obstacles against urbanization and modernity which could also be seen as obstacles on increasing life quality measured at building and living standards.

# 4. 5. 4. Housing Standards: Low Standards vs High Standards

I will look at housing standards as indicator of life style which can also indicate urbanization and modernization processes. Housing standards will be accounted under the main titles of building standards and living standard. Particularly, building standards have decidedly been illustrated the family types when we look at size and density of family members who live under the same roof i.e. household.

### 4. 5. 4. 1. Building Standards

Building standards have been constructed on nine items. They are namely, house type, number of rooms, house size, kitchen, bath, toilet in house, savage, water and electricity. The scale range from 0 to 105 points. There are also five group on the basis of housing scale, as they are illustrated at table-27. These five groups have been constructed on the bases of following items (illustrated at table-26) besides size and number of rooms.

Table-26: Ownership of some selected Consuming Facilities in Houses

	have		have	not	hav	e	have not	
	N	%	N	%	N	%	N	%
Kitchen	114	97.6	10	2.4	474	99.0	4	.8
Bath	388	91.7	35	<b>8.3</b>	456	95.4	22	4.6
Toilet	378	89.4	45	10.6	475	99.4	3	.6
Savage	396	93.6	27	6.4	455	95.2	23	4.8
Water	416	98.1	8	1.9	475	99.4	3	.6
Electricity	423	99.5	1	.2	478	99.8	1	.2

Table-27 and 28 shows more visible differences among class locations which are also indicated by size analysis which these differences have been blinded when one look at crude statistics on number of rooms and square meters of houses. It illustrates a counter argument against equality at number of rooms. There are no members of capitalists, small employers who live in houses with low standards in Kırıkkale and Ankara as well as no managers, supervisors and petty bourgeoisie have stayed at same quality houses in Kırıkkale. Houses with low standards also largely occupied by casual workers and petty traders in both Kırıkkale and Ankara.

# 4. 5. 4. 2. Size Analysis: Extended and Large-Scale vs Nuclear and Small Scale Families?

Differences at household structure may been also interpreted as indicators of modernization processes. Thus, it can be argued on class locations belonged to CMP will have more small size, less density, more nuclear, more employment, and fewer dependency ratios in contrast to locations belong to SCMP. It is generally argued modernization goes parallel with disappearing of extended family and occurrences of nuclear family which has been characterized not only of a couple of partners but also lesser size than extended one. In this

frame of references, it should be studied on where is Kırıkkale and Ankara with their particular class locations taking place on transition towards modernization, i.e. disappearance of extended and large scale families and construction of nuclear and small sized ones. It should also be assumed that class locations belong to capitalist modes of production will have more nuclear type family in any cases.

Table-29 and table-30 demonstrate that Kirikkale has approximately one more persons per each household than Ankara as well as more than averages of Turkey in which it is 5.22 for rural and urban places together, and it is 4.47 for urban places alone. Largest families have been in locations of capitalists, small employers, petty traders, supervisors and petty bourgeoisie whereas they are belonging to casual workers, skilled workers, capitalists and petty bourgeoisie in Ankara, respectfully. Also, experts have smallest families in both cities; whereas managers and small employers have second more small sized families in Kirikkale and Ankara. On the other hand, both tables (29 and 30) also pointed out low level of differences between class locations considering of family sizes. In other words, both large scale and small scale families have been at every location in itself.

On the other hand, there are three main groups of family in both cities, that is, extended, transitional extended and nuclear ones. It could be expected that class locations belong to capitalist mode of production will have more nuclear or transitional extended forms whereas petty bourgeoisie and casual workers will have more extended ones. However, distribution of respondents by family types within class locations shows low level of differences although some agglomerations can also be seen (See table 31).

Proportional rates of extended families have roughly equal to proportional rates of large scale families which have been defined as families with six or more persons. Extended families have largely been within supervisors, small employers and petty bourgeoisie in Kırıkkale; whereas they are at locations of skilled workers and petty bourgeoisie. Also, experts have least numbers of extended families in their own class locations in both cities.

# 4. 5. 4. 3. Density Analysis: Expanded vs Shrinking Families

Table-32 and table-33 indicate that number and proportions of persons per room (density 1) and domestic spaces as square meters per person (density 2) in Kırıkkale and Ankara. These two measures will be evaluated as indicators of population density in household. It should make some sense on how many members have opportunity to have private spaces in home. Density analysis should not be considered as a simple analysis of housing space. Domestic spaces of houses have necessarily indicated a particular way of life dependent upon objective conditions-possibilities of private spaces for persons in home. Possibility or reality of private life in houses is one of the very basic conditions for modernization. And, such a possibility can largely be calculated on available spaces for individual persons in domestic spaces of homes.

First, Kırıkkale, with also more deviation within itself, has more dense families than Ankara. In Kırıkkale where capitalists, petty traders, casual workers and small employers have top grades on density-1, only experts of Kırıkkale have lesser grade of density-1 than average grade of Ankara. Experts' houses have more spaces for their members in Kırıkkale than all other locations. Supervisors and small

employers have following grades of density-2 in Kırıkkale. On the other hand, small employers and capitalists have top scores on density-2, in which experts have third rank. However, experts have also less amount of persons per room in Ankara.

Multiple r square =	0.020		0.030	

In this context, experts have more expanded families in Kırıkkale and one of them in Ankara. Capitalists and small employers have still live in shrinking backgrounds in Kırıkkale where supervisors and skilled workers have some potential of getting more expanded family types. Expansion of domestic life has also mean that an increase in privacy of personal lives as a necessary condition for individualism; whereas shrinking on domestic spaces can lead persons either to be in tensions against other or tribalization.

# 4. 5. 4. 4. Living Standards: Levels and Patterns of Consumption

Consumption will be conceptualized in a gradational approach as consumption levels on the basis of living standards as it is defined in following paragraph. In other words, question is not to classify and conceptualize consumption within itself, as Maslow, Illich or any other do it. It is simply to see whether there is any significant relation between class locations and consumption level or not. However, it can also be argued that high level of consumption means also an increase in modernity of consumption; because consumption goods have largely been supplied by money and market economy in Turkey. In this sense, it can be argued that capitalist locations will have high levels of consumption as well as they have also more modern consumption pattern.

Living standards have made basically of 20 items indicating permanent consumer goods in houses, which are indicated at table-34 with information whether respondents have or not them. The scale of consumption ranges from 0 to 110 points.

Table-34: Ownership of Some Selected Consumer Goods

	Kirikkale				Ankara

Capitalists, small employers, petty bourgeoisie, and managers have no member who live in group with living standards of lowest in Kırıkkale. Whereas, petty bourgeoisie have a member at this level as well as petty traders and supervisors have no member at lowest grade in Ankara. In this frame of references, some of supervisors and skilled workers looks like resisting to increase their living standards at home, whereas managers have a well improved living standards or way of life from their location on income. Capitalists also have no adequate way of life corresponding to their income. Inter class differences are more visible on mean values, as they are indicated in Table-36.

#### **CHAPTER V**

### **CLASS FORMATION**

Process of class formation has been identified by Giddens, with his decisive emphasis on structuration rather than structures (1983) on the basis of mediators providing inter-class transmissions. These mediators have been identified as 1) ownership of property; 2) possession of educational or technical qualifications; and lastly, 3) possession of labour power. Wright's model consists precisely of last two aspects of Giddens' structuration within the conception of class locations rather than formation through the items of controlling and using other's labour. Wright's model also necessarily excludes ownership of property as a factor determining class locations, except ownership of means of production.

On the other hand, there are two basic ways of analysis for class formation in Marxist theory. First, traditional Marxism, under a strong influence of Lenin has generated some basic concepts on the analysis of class formations. They are 'class in itself' and 'class for itself,' 'class interest,' 'true consciousness,' 'false consciousness'

(Poulantzas, 1978: 104-115). Class in itself defines objective conditions i.e. economic bases of social classes; whereas class for itself defines social classes which act in accordance with its own particular class interests, determined by class's position in economic relations. Class interest made of the economic interests of social classes at national and international (i.e. abstract-theoretical) level but not the material interests of individual members. If it could be reversal of particular interests of individuals; individuals have to act in accordance not to their particular interests but to the interest of social classes as a totality. False consciousness and true consciousness has been exemplified through the first and second ways of actions, respectfully.

Although, Lenin identifies objective conditions as necessary and enough conditions for identifications of social classes, it can also be argued that social class exists, if only it exists as class for itself in political arena (Poulantzas, 1975:14). In this context, basic question is deciding what is the true consciousness of economic class interest. Marxism identifies a central political organization either as 'international' or 'socialist party' as the final decision maker. This generates a fatalistic mode of reasoning which advice obedience to political leader, a fetish who is alone at the top of central organization with his attached supernatural perfectness. An ordinary, party member has no potential to get such characteristics. Also, this frame of

references generates not only fatalism and ambiguity for ordinary people deciding to what class interests are in daily lives; but also generates problem of operationalization for sociological analysis.

On the other hand, it can also be argued that Marxism, free from leaders' definition of true consciousness, should have some clues for analysis of social, cultural and other superstructural occurrences. From the beginning, it must be distinguished that Marxism has a 'capitalism bias,' occurring on the examples of urban and industry bias. Because, Marxist understanding of history, under a great suppression of Darwin's model of evolution, not only identifies as an end to historical development but communism conceptualizes the history as a chain of succeeded stages of growth in which each stage has necessarily be more or less developed with respect to other. Human history accelerated from apes began with production and reproduction of means of production and human life. This is the reason why Marxism identifies societies in accordance with economics. Mind is not a cause but a result of this process. Process of 'humanization' is a kind of struggle against wild nature, necessarily proposing men and women to work and being productive not only to win nature but also to become a human being. In this context, existing human history has been defined as a combination of four stages of growth, namely primitive commune, slave society, feudalism and capitalism, respectfully, in which capitalism is most developed stages of human history.

Capitalism biased of Marxism generates very characteristic conception of urbanization and urbanism which are available to get an 'objective' formulation of true consciousness for Marxism. Urbanism defined has been as industrialism and capitalism commoditization through money and market economy. Also, it is identified with negations of historically given habits i.e. traditions and beginning and accomplishing a pragmatically oriented mind. Man at urbanism, industrialism or capitalism has a better reasoning than men of previous times. Urbanism or industrialism or capitalism have already been defined in contrast to peasantry. Marxism, even when it argues how peasantry has a respectful importance for socialism, has an undeniable hostility against peasantry. In my opinion, this kind of cognition has been well constructed by Weberians and Modernization theories rather than Marxism.

Second, fluidity and permeability controversy has been constructed for analyzing class formation by Marxist analysts. Fluidity meant that low level of class formation whereas permeability shows an increase in formation. Levels of fluidity and permeability have been accounted through inter and intra generational mobilities; and also

cross class relations in family, friendship, organization etc. Thus, process of concept formation fused two different level of analyses into each other; that is, historical and structural. Inter and intra generational mobilities are historical evidences; whereas cross class relations are structural evidences. Because, these two categories have necessarily make sociological analysis be limited within the frame of class formation; and excluded some other social processes from the analysis, such as migration and urbanization. Theoretical categories should be available to see the differences among, for example, petty bourgeois of small town, middle town and national capital, who has same scores of fluidity and permeability. Then, I prefer the terms of social mobility and cross-class relations rather than fluidity and permeability.

Therefore, I studied on class formation under two basic titles of social mobility and social relations as they are also further divided into sub-titles rather than permeability and fluidity controversy and theories of urbanism generated within Marxism in itself.

## 5. 1. Social Mobility

Concept of social mobility has been defined loosely and heuristically as spatial mobility and cross-class mobility. A high rate of

social mobility should also been expected in two cities as cities of a rapidly changing society. There will be at least two basic groups of people, that is, ones with high rate of mobility (less rate of stability) and ones with low rate of mobility (high rate of stability). With less hesitation on social and ideological functions of stability, I will look at whether there is any relations between class locations and these 'mobility groups'. That is, groups shaping through urbanization. Then, spatial mobility has also meaning of migration and urbanization. Thus, there are two other groups, as migrants and natives, which can also be identified as urban basis of social conflict rather than class conflict. In this context, question is whether class formation has been succeeded over other group formations based on spatial mobility, migration and urbanization.

## 5. 1. Spatial Mobility: Migration and Urbanization

Spatial mobility has been conceptualized through migration and consequent urbanization processes. Migration will be comprehended as a personal action which realized in accordance with personal expectation and decision making processes (Harris and Todaro 1970). Modernization theory explicitly and marxist theories of urbanism implicitly argue that voluntaristically migrated persons are the

persons who have more rates of entrepreneurship, modernity than persons who have no changes on their dwellings. They are the persons who have migrated from rural to urban, from periphery to central, from agricultural area to industrial one etc. On the other hand, their modernity i.e. urbanism have been increased by increase of their duration of residence at urban areas, and vice versa. Migrated persons's modernity is more than their rural equivalents but lesser than urban dwellers (Kıray, 1972a).

There are also possible differences among migrated persons on the basis of their personal relations both to rural or peripheral backgrounds and to urban environment. If their relation concentrates on their countrymen in urban areas; on their rural or peripheral background they will have probably less modernity and urbanism. If they will be more integrated to urban environment they will be more modern.

### 5. 1. 1. Migrants vs Natives?

One of the very basic question for urban analysis should be deciding to whether urbanism means being a native of urban places or not. Long term of duration of residence at urban places really means of being urban? I will discuss on nativeness and being migrants on two

basic variables, hometown of respondents parents and birth place of respondents. In fact, these variables will also indicate level of urbanization for respondents and belonged class locations. Table-37, shows whether respondents' old family is permanent residence or newcomers. Although majority of population in both cities is newcomers; their proportional rates higher in Kırıkkale.

Ayata (1987, 1990) argued that segregation between natives and migrants are real basis of social conflict realized through labour market and housing-squatting areas in urban places. But, all newcomers or migrants are not real migrants, particularly in Kırıkkale. Some of the newcomers have come from Kırıkkale's and Ankara's own rural and urban hinterlands; whereas some of them have really migrated from other territories. First group has a tendency to label themselves as natives and others as migrants, especially in Kırıkkale. Thus, there are also two main groups within natives themselves as non-migrant natives and migrant natives of surrounding hinterlands. In this context, natives consists of non-migrants and migrants from neighboring territories; whereas migrants are migrated persons from other provinces of Turkey. Indeed, migrants natives have been originated from rural areas in Kırıkkale (61 %) in which there are only 16.7 % of migrants with urban origins whereas they have mainly come from small urban areas to Ankara (49.6%) where there are only 26.6 % of migrants with rural origins.

Table-37: Migrants and Natives in Kırıkkale and Ankara

	Natives	and Migrants		<del></del>		
	Kirikkale	)	Ankara		Total	
	N	%	N	%	N	%
Town residents	29	6.8	105	22.8	134	14.82
Town Residents from Hinterland	207	48.7	4	0.8	211	23,34
Migrants	189	44.0	370	76.0	559	61.83
Total	425		479		904	99.99

Excesses of migrant natives within total number of population have some considerable influences on social constructions. They try to legitimize themselves as natives i.e. owners of urban and rural county although they are not real natives but migrants. Then, in order to evidence their nativeness, they cultivate a hostility against migrants, stronger than hostility of non-migrant natives, if they have any.

This hostility is consequence of development of economy and politics as a symbiotic totality in Turkey, which is very obvious in Kırıkkale. This coexistence make politics to be a kind of clientalism where patronage relations have predominance (Ayata, 1990). Both

capitalists, salaried and wage workers have mostly generated by state interventions. Hence, personal interventions which are able to affect state interventions are determinants both of being a rich employer for capitalists, small employers, petty bourgeoisie and traders; getting an employment in state offices for other locations. 'Rüşvet' (bribery) and specifically 'torpil' (nepotism) has commonly been accepted as the only way of getting such success from state officersbureaucracies in Turkey. Torpil which is more widely used also a political mean of solidarity, i.e. nepotism; whereas bribery is a crude mean of economic marketing, i.e. favoritism. Thus, nepotism can easily and necessarily be used not only for getting a regular employment in public works but also promotion in work place. Promotion is under control of political leaders in official work places whereas it is also affected by union leaders. In other words, trade unionism under control of political leaders directly or indirectly has also a parallel with politics in Turkey, as it will also be discussed later.

In this context, the nativeness means having votes more than migrants have. This may not only make nativeness be more important for political representatives (even candidates) who have great influences on bureaucracy and other official activities; but also for countrymen themselves. Being a native becomes very important moral issue for persons of territory. On the other hand, identifications of

boundaries for natives has no end. There are three major sub-groups among migrant natives at Kırıkkale, namely Keskinlis (Keskinli'ler), Obalıs (Obalı'lar) and Ahılıs (Ahılı'lar) who have been already struggling with each other to get political leadership in community.

Particular emphasis on ethnic locality (hemşehrilik) in migrated urban areas of Kırıkkale and Ankara could probably generate it's antagonist, that is, ethnic locality constituted around country migrated off. Foreigners also become well aware of their power to shape politics in their own favor by increasing their group cohesiveness or closure for themselves. In this frame of references, question is not simply whether or not any significant relations between class location with natives and migrants; but also class locations and hometown identified around.

Table-38 and Table-39 indicating birth provinces of respondents and last places of residence before migration to Kırıkkale and Ankara within class locations also verify that Kırıkkale has diproportinately more numbers of migrant natives than Ankara. In fact, natives have largely been challenged by foreigners at certain locations, namely managers, experts and petty traders. It is also important that major group that is challenging is made of Kırşehirlis, ones of neighboring city of Kırıkkale, who are probably alavis also. Strength of natives at supervision indicates relative power of natives within trade unions. Supervision has not necessitated work actively whereas activities of management and expert needs active interventions on work. Then, natives make themselves promote into the status of supervisors through probably of their accumulated effect in trade unions which one of nation wide union's president is also from Kırıkkale (oba) who have necessarily look for votes in union elections. On the other hand, largest proportion of natives within unskilled workers has shown that Kırıkkale already lost its pull effect, ability of creating employment opportunities for foreigners.

# 5. 1. 1. 2. Hometown Linkages: Urbanite vs Peasants?

It could also be questioned whether natives are really more natives than the others; also whether natives are more urbanized than foreigners. For this purpose, I will use data on duration and hometown linkages of respondents in Kırıkkale and Ankara. But, for class analysis, question is only whether there is any significant differences between class locations with respect to duration of residence or residential time or not.

Table-40, shows that no location is more native or more urbanized than the others; or in other words, each locations have their own internal segregation as natives and newcomers. Also, Kırıkkale have more established i.e. urbanized community than Ankara if we take the residential time or duration of residence as criterium. Most established groups are petty traders and skilled workers whereas most new ones is capitalists and managers in Kırıkkale.

On the other hand, table-41 indicates that urban dwellers have disproportionately closely knit relationships with their hometown in Kırıkkale than Ankara. More than 22 % of total respondents have gone into their hometown once in a month in Kırıkkale whereas people with

same kind of relationship have consisted only of 5.4 % of total population in Ankara. In my opinion, it is relatively important to point out that 21 % of total populations have lesser amounts of relations with their hometown in both cities. These people are probably real citizens of Turkey rather than of Kırıkkale and Ankara.

In short, we can argue that Kırıkkale residents with their all class locations have seen as divided into three main groups through urbanization; that is, 1) migrants, 2) migrant natives from surrounding hinterland, and 3) non-migrant natives. Last two groups have three subgroups on the basis of their relationships with their hometown which could be called as groups with middle, highest, and lowest relations with their backgrounds, respectively. Also, it must be pointed out that urbanism doesn't mean high level of duration of residence at stayed urban place. Class locations have no significant differences on these processes, except experts. They are younger, more feminine, more educated etc. In this context, a probable conflict, if it will be got shape will be realized between a group combining natives to migrants who have lowest grades of relations with their hometown, and experts and a group combining migrant natives and plus all other class locations.

### 5. 1. 2. Cross-Class Mobility

Cross-class mobility will focus specifically on what has been conceptualized on the bases of inter and intra generational mobility: the types of 'class trajectory'. In this sense, it could be argued that there will be more permeability between parents class locations and respondents class locations if the class formation increase. There will

probably no significant differences among class locations, considering inter-generational social mobility due to rapid process of social change.

### 5. 1. 2. 1. Inter-Generational Mobility

First, cross-class mobility should be identified with respect to father's class locations, because most of the mothers have no regular income. I will also combine capitalists and small employers into the category of employers; combined petty traders and casual workers into the same category, as they are indicated in Table-42. Table-42 have pointed on low level of significant differences among respondents class locations with respect to their fathers class location in Kırıkkale than Ankara. In other words, Kırıkkale have a population with high level of cross-class mobility; high level of instability. Society is full of chances and risks: every body can go top as well as go down. Most of persons in all class locations are made of children of petty bourgeoisie i.e peasants. It should also be noted that class polarization has any social basis. Percentage ratios of workers who are children of employers, petty bourgeoisie, managers and supervisors and workers are as follows, respectfully: 60 %, 52.5 %, 60%, and 54.2 %. In other words, there is no well established and strictly closed borders among class locations.

Workers have most stable continuities between fathers and children' class locations. Majority of workers' children have also be a worker. However, workers' children have also hold class positions at other locations where they are skewed toward managers and supervisors at 16.2 %. Also, majority of present workers is not workers' children but children of petty bourgeoisie i.e. peasants in Kırıkkale.

Ankara has little bit more permeability i.e. stable continuity on cross-class mobility as it has been defined through continuity between fathers' and children' class locations. Majority of children of managers, supervisors and workers have also hold fathers class locations later. However, petty bourgeoisie still keep his position as major suppliers of urban social classes at Ankara also.

only few of them have a regular occupation. Only 22.5 % and 36.7% of mothers have been declared as employed in Kırıkkale and Ankara. And also, only 7.5 % and 6.1 % of mothers who are declared as working are wage workers. In fact, mothers with wage work have made of 1.5 % and 2.1 % of total numbers of mothers in Kırıkkale and Ankara.

### 5. 1. 2. 2. Intra-Generational Mobility

Intra-generational mobility has also been comprehended deciding to the level of fluidity and permeability in class formation. For this purpose, due to the lack of available data to identify respondents' previous class location, I will look at changes in occupations within respondents own life times (See Table-43).

In this context, Kırıkkale has more permeability with average score on changes in occupation, 1.26 which is less than the score of Ankara, 1.77. Experts, supervisors and unskilled workers have seen as most permanent locations in Kırıkkale whereas they are casual workers and petty traders and managers in Ankara. On the other hand, small employers, petty traders and casual workers in Kırıkkale; and supervisors, skilled workers and unskilled workers in Ankara are most fluid class locations. In other words, although there is less correspondence between changes in class locations in both cities, Kırıkkale has a more stable class structure than Ankara.

#### 5. 2. Cross-Class Relations

Analysis on cross-class relations looks like a somewhat network analysis which looks for group formations and institutionalization. In fact, I have not illustrated a formal network analysis which produces a map of domains, identified as central and secondary-peripheral areas of human life in daily activities. Here, I will simply look at positions of respondents partners' and friends' class locations. These analyses will also enable us to comprehend something on fluidity or permeability of class locations, although fluidity have largely be defined with inter-generational cross-class mobility.

### 5. 2. 1. Class Correspondence among Partners

Table-44 provides evidence for a discussion about whether is there any significant differences among class locations with respect to their partners class locations.

But, table has given no sense, because, there are only a few female partners who have a regular employment in Kırıkkale; whereas there are for times more employed females in Ankara which have in fact four times lesser than employment ratio of males.

Table-44: Correspondences between Partners' Class Locations

### 5. 2. Class Correspondence among Friends

Friendship is the second step of human relations between private family networks and public domains. There are three basic alternative for employed persons to constitute friendships, namely, neighborhood, job maid, and friendship at other spheres of life. Question for this study is not deeply analyze mechanisms of

neighborhood, job maid relations or any other networks of friendship; but it is simply to illustrate how much friendship constructed among class locations and to decide to whether is there any significant correspondence between class locations on this basis.

Tables 45, 46 and 47 shows that there are significant differences among class locations on friend preferences in Kırıkkale. However, it doesn't mean that all locations can close within themselves. Increase in significance is probably a result of workers' proportional weight in total population in which 66 % of total friends are made of workers. In this context, workers have appeared as the location with high level of social closure if the social closure has been defined as friendship between persons belonged to same class location both in Kırıkkale and Ankara. Petty bourgeoisie and managers have also high levels of social closure in Kırıkkale.

On the other hand, more interestingly, friendship lost its power in Kırıkkale rather than Ankara. There are only 65.2 % of persons who can declare a third friend, whereas 77 % of respondent have a third friend in Ankara. In other words, Kırıkkale has relatively more close knit ties at friendship networks. Individuals have closed their rooms to others after they have selected their friends; and strictly defined life domains for themselves and for their limited number of friend. Also, most of urban dwellers in Kırıkkale have declared their relatives as their friends. That is, they have concentrated into their given biological networks.

Table-48 pointed out that gender relations in public domains, free from class locations, have also largely been disappeared. This disappearance make people to get marriage. There are probably no healthy places for non-married persons at Kırıkkale. Thus it can be argued that there will be a conflict, if will be any, between tendencies, open and closed social relations but not social groups and social classes.

### 5. 2. 3. Class Segregation vs Integration in Associations

# 5. 2. 3. 1. In Associations in General

From the very beginning, it must be pointed out that only 29.17 % and 20.25 % of total populations have membership in formal organizations in Kırıkkale and Ankara respectively (See table 49). Also, it must be pointed out at most of the membership into organizations have largely realized as the memberships of vocational associations which are a legal necessity for entering into labour market (See table 50).

Table-50 does not only shows that there is no significant differences among class locations with respect to their membership into formal associations; but also shows that membership into formal associations is grater in Kırıkkale than Ankara. I think that this also proofs that residents of Kırıkkale are well aware and hopeful from central government. They are conscious enough to comprehend politics as a patronage relation, free from their differences through class locations.

#### 5. 2. 3. 2. In Trade-Unions

As it will also been mentioned in discussion on politics and religion, trade union-ism has also very basic characteristics of clientalism in Turkey. As politics and religion disseminated over local community, trade unionism has also been introduced from above/center. Thus, trade unions has available to be used in patronage relations in order to get maximum benefits for their `ruling oligarchy' which have been settled not only at the top of union organization but also through work places. Thus, ruling oligarchy have not only composed of top level executives but also lowest level executives in work places. This second group of ruling oligarchy consists of masses in Kirikkale who may take position in social, cultural and political

conflict. They are not real workers, but they are mainly union's professionals.

Table-51 indicates personal responses for question given like "whether trade unions have any necessity for national politics; increasing workers rights in any kind, increasing workers' solidarity among each other, improving workers social rights, increasing workers wage, and improving firm managing at work places." In Kırıkkale, only 3.2 % of total population have declared their opinions on trade unions as that they are unnecessary; whereas Ankara has more people who declared their opinions as such.

On the other hand, people of Kırıkkale have sharp differences on their opinions on other functions of trade unions. In Kırıkkale, approximately 78 % of total respondents have saw no necessity for politics as well as 76 % and 67 % have also seen no necessity for managing at work places and working class solidarity respectively. For peoples of Kırıkkale, unions are necessary mainly for workers benefits. In other words, these persons see unions are necessary; but they have less ability to define why they are necessary.

In Kırıkkale, only 53 % of persons argue that unions are necessary for improving wages. Also, 59 % of persons declare that unions are necessary for improving workers social rights; which these rights are also social wages added on net wages. Everybody in aware of unionism in Kırıkkale is wage unionism but if the wages have been

defined as social rights i.e. supplementary wages paid in cash and kind. In other words, unionism is not a way for class formation, even for workers.

## 5. 2. 3. In Politics: Modernist vs Ottoman Followers

Politics and social changes in Turkey have generally been discussed on the basis of model `revolution from above' (Trimberger, 1978). In this model, question is how much Turkish revolution can get success on social transformation and modernization. This model has also correspond to the issues presented by Turkish revolutionaries of 1920'es who got the power before a nation has no reality under occupied land; and to the issues of nation building approach put forward.

After their success on independence war, modernist elites identify their goal as 'to arrive at state of contemporary civilizations' (Oran, 1993). In other words, they look for western capitalism as their basic goal. They identified two basic obstacles preventing arriving at this goal: 1) western capitalist nations by themselves; 2) sharia and its organized body, Ottoman State (Timur, 1993).

In this context, Turkish politics has structured on a debate questioning around how [ottoman] state can be salivated (Mardin, 1983a). This state centered emphasis make politics be a kind of tutelage and clientalism, where structure of politics have also been identified as corporatism, authoritarianism etc.. Basic questions have largely been formulated on the basis of a very common question 'how we can go into masses, how can we get precise relations with them, or how can we organized them within our preconstructed political party, with its own pre-decided truths etc.. Thus, political ideologies and behaviors should be comprehended as answers against such questions.

There are four basic answers, proposing pan-Islamism, pan-Ottomanism, pan-Turkism under a strong central state and lastly, federalism. Pan-Islamism and pan-Ottomanism has lost their power via both alliance of muslim Arabs with christian nations against Ottomans in World War First, and also flee of Padişah's, head of Islam from istanbul, capital of Islam, to a christian land after a long period of struggling against revolutionaries who look, in fact, for state's salivation. Pan-Turkism, as a racist attempt, has also lost its feasibility by October Revolution in Russia. Most of the Turkish communities have joined into the revolution either by their free will or by physical suppresses. Federalist advises have largely been realized by last Ottoman Governments but they gave away state to disappear. Thus, new

republic through its official part CHP, formulate his ideology, as a synthesis of world civilizations on the basis of Turkism as the turks who have been identified as Turkish speakers and men who live in land under the control of new ruling elite.

In other words, new republic identifies his basic enemy as Islam and Ottoman followers rather than any other thing. Western capitalist nations are also second basic antagonist of new republic already prevented they have any attempt toward because modernization, industrialization and entering into conditions of money and market economy based on private property. New ruling elite challenging western nations and sharia by his argument on secularism. Secularism looks for international relations free from religious prejudices. It invites western state to be free from their religious pasts. Also, secularism looks for separation government bodies from hegemony of religion i.e. sunnite Islam in Turkey (Berkes, 1978). New elites looks for new laws and court regulations from European states; and immediately applied them in Turkey. Last, secularism advises for people as a new way of life. New elites identifies this new way by various ways, such as dressing, music, dancing, education etc. For these purposes, new elites have suppressed not only of leading followers of sharia by also ordinary people belong to Islam in crude

ceremonies. This probably makes some of the ordinary people be hostile against new elites also.

At late 1940'es, a new group, namely Democratic Party have emerged at political scene as followers of the ideas of federalists at late Ottoman period. But they also appropriated the sunnite Islam as a tool to pick up votes in a decisively opportunistic approach. They took the power at 1950; and rule the state and society until military coup of 1960, which had ended by assassination of three leaders of Democratic party. This assassination has also strengthening hostility of masses against modernist elites. These masses identifies their ideologies at late 1960'es as rightwing politics after modernist elites of CHP define their ideology as `left of the middle.' Thus, there are two basic groups and various sub-sects within themselves at Turkish political arena (Kongar, 1981: 139-41).

Modernist elites of 1920'es formulated a strong centralist ruling model for nation. And then, began to organize local communities as parts of new totality, from above. Politics as one of the way of the organization has been conceptualized as a system of tutelage. This conceptualization make politics be a system of clientalism at later moments in time. DP had no counter action against model; in turn, DP has properly used established political mechanism

in order to increase its social basis. Politics began to be conceptualized as a way of transforming money-capital from center to the periphery; distributing wealth to the members of political parties stayed at local areas. Thus, politics have increasingly became a pragmatic apparatus of pick up wealth and statuses for rightists, whereas it has still been valid as a moral issue for leftists.

Thus, followers of 1920'es modernist elites both in CHP and out of CHP overtly began to oppose against central state at late 1960'es. They are rapidly beginning to formulate their ideologies within general terminology of socialism. But, in fact they are not radical Marxists but socially minded intellectuals who formulate their ideologies under great influences of Kemalist formulations of 1920'es (Karpat, 1973). On the other side, followers of sheria, federalists and all other followers of Ottomans reformulate themselves as conservatives whereas they are also labeling leftists as communists on political arena. Rightists began to compete to each other to use Islamic cultural codes as political materials. Thus, Islam becomes a relatively well cultivated political storage of votes where the vote owners have probably be in aware of value of their own votes.

In any case, although systematic military coups destroying political system, there was a relatively established system of political

parties in Turkey where actors have characterized themselves under two basic titles, as leftists-progressives and right wing-conservatives or similar terms. Thus, politics must be conceptualized in accordance with these historical evidences rather than evidences of developed capitalist societies. In other words, affiliations on political ideology are more important than political party preferences in Turkey. And, left and right have not necessarily show class based politics on working class and others.

I will construct politics on the basis of respondents' affiliation on political ideologies operationalized through political parties at local and nation-wide elections rather than their relations with political organizations because only 7.76 % and 2.92 % of them are members of political organizations in Kırıkkale and Ankara, respectively. From the very beginning, it must be pointed out that membership into political parties for employees of public firms are forbidden by legal codes in Turkey. However, high rate of membership in political parties in Kırıkkale; although it is a city of public employees can only be comprehended by clientalist nature of politics in Turkey, as it has already be mentioned.

In this context, right wing political parties are argued as ANAP, DYP, MÇP, RP, IDP as they are in survey time; and leftist

parties are argued as SHP, DSP, SP by the same way. Some of the population have also no clearly defined affiliations on political parties. I call them as a-politics heuristically, without any precisely constructed argument of my own. Some of the people have also no answer or no relations to politics. Proportional rate of respondents who have declared their political affiliations are 93.41 % and 94.73 % of total population in Kırıkkale and Ankara. If we can add these non-respondents to number of the a-political respondents; we can also argue that 13.39 % 18.56 % of total population would like to live out of political domains in both cities.

Table-52 have also no significant differences among class locations concerning affiliation on political parties in both cities, although there is a relatively lesser significance in Kırıkkale and vice versa. More than fifty of persons belonged to all class location have right wing political party affiliation, except experts with their 48.1 % in Kırıkkale. In Kırıkkale, more then 60 % of total population have stayed in right at political arena, where a leftist tendency can be expected because it is a city of proletariat. There are no class location with leftists have more than fifty of respondent within itself in Kırıkkale (See graph 3 and 4). Leading locations of right politics in Kırıkkale are capitalists, managers, petty bourgeoisie, skilled workers, unskilled workers and petty traders with respect to proportional weights of right affiliation within total populations of each location. Largest groups are composed of skilled workers and petty bourgeoisie in Kırıkkale.

In other words, economic bases of class locations have no significant influence on political party affiliations as the bases have been defined as capitalist and small commodity modes of production in Kırıkkale. Capitalist, workers and petty bourgeoisie can easily be come together. On the other hand, there are four class locations who have skewed into leftism in Ankara, with more than fifty percent of leftist affiliation within themselves, Ankara have also more leftist vote than rightwing affiliation in total population. These locations have been

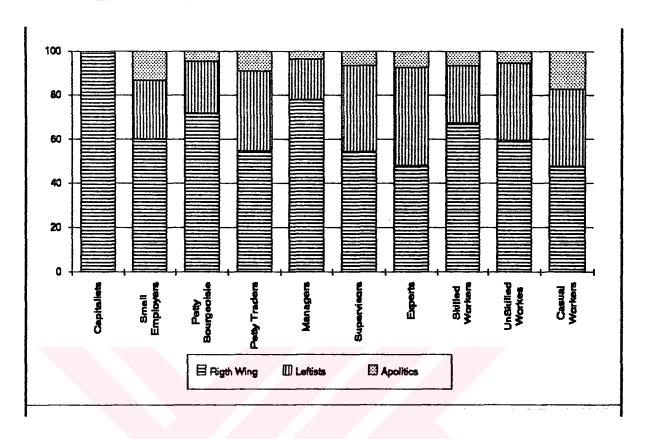

stratified as follows, capitalists, small employers, experts, and casual workers with respect to proportions of leftists within total populations of locations, separately from each other. Although, there are also definitely rightist class locations in Ankara, namely, petty traders and petty bourgeoisie. Continuously, there are also a similar distribution of political party preferences at last national and local elections in both cities.

Political party preferences can change in particular, but affiliations of political ideologies have not. Seventy one percent of people has declared their affiliation towards rightwing politics and 71.4 % of people have vote for rightwing politics in Kırıkkale; as well as 27.8 % of people have declared themselves as leftist and 26.9 % of people have vote for left at national elections (See table 53 and its graph-3). However, Ankara have a little bit more floating votes than Kırıkkale. There are 46.8 % of people who say that they are right wing political affiliation whereas there 50.3 % for right wing political parties in national elections. That is to say, there are approximately four percent of floating votes in Ankara, whereas same proportion can probably be less than one % for Kırıkkale.

It seems that political party affiliations have largely been affected by political tradition which has already been mentioned political traditions in Turkey. In Kırıkkale right wing political parties have got the majority of votes by combining exploited and exploiters class Location. In Ankara, more interestingly, leftist affiliations have largely been shared by capitalists and small employers. In this context, one of the very basic political question is which one has true consciousness of their economic interests. Table-54 indicates causes of party affiliations for Kırıkkale and Ankara.

Disproportionately huge amounts of people have declared 'pragmatic' causes in Kırıkkale whereas majority of people has declared ideological and moral issues in Ankara. I think that these responses indicate that right wing political parties, from their ruling elites to rule masses have much more successfully used political apparatuses for their own benefits, whereas leftists seek to moral issues.

#### **CHAPTER VI**

#### **EXPLANATORY POWER OF SOCIAL CLASS FOR HUMAN ACTION**

Sociological analysis and consequent conceptualizations are not ends by themselves but means for further goals. One of the very basic question for class analysis and class conceptions must be deciding to whether they have any significant relationship to social relations or not. If class conceptions, as paradigm in Kuhnian sense, has no power of explorations and explanation on social relations or any other social occurrences-constructions, they must be eradicated by sociologists (Kuhn, 1970). Then, there are two basic questions for class analyses. One of them as it has already been put forward is identification of what social class is an a dependent variable with it's constituting elements. Second question, on the other hand, is conceptualization of social classes as independent variables influencing over dependent ones, i.e. other spheres of social reality.

Marxist and Weberian models which conceive social classes as economic categories also determine generic problems for such a class analysis. Both Marxism and Weberianism looks for a parallelism

between economic and social spheres of human realities. Marxism, by a constructional analogy, comprehend society as a combination of economics and other levels which are reflections of economic base. Economic level is called as base-structure i.e. base for all other levels consisting of culture, politics, social relations which are called as super structural levels. Marxism is necessarily economic reductionist. Therefore, it is, in fact, no decisive discussion on whether economic base has a direct determinance or determinance in the last instance on social or political actions at overstructural frame of references, as it has already discussed by Althusser, Balibar and Poulantzas. This is what makes Poulantzas (Poulantzas, 1978) be already continued to study on the relationship between economic base and political actions although he has shared an argument on determinance of political actions for social class.

Also, as it has partly been discussed through chapter on class formation, Marxist model of social change conceptualizes human being as capitalism or modernist theory defines it as 'homo economicus'. Thus, it could be argued that persons belong to class locations of capitalist mode of production will be much more modern, democratic etc. than the members of precapitalistic locations. I will look at following items to think about.

### 6. 1. On Gender Relations in Family

Gender relations of the basic one indicators modernization theory. I will look for male participation into routine house tasks and female participation into decision making process in family networks in order to decide on gender relations. If male participation becomes higher; democracy, modernity, or liberty on family relations is also be higher, and vice versa. In this sense, for this study, question is not decided on whether females have been exploited or not; and if they are exploited, to measure how much and through which mechanisms they have been exploited. But question is simply observe whether male partner of household have been participated into routine house-tasks or not.

# 6. 1. Male Participation into Routine House-Tasks: Fallacy of Shopping

Male's participation into routine house tasks will be comprehended through two basic ways. First, it will be observed as single items of cleaning of houses and dishes, cooking meal, laundary, shopping, and child caring. Second, these items will be combined as a scale. But scale will also be constructed in three different ways. First, four items of cleaning up dishes and house, shopping and cooking

meal will be comprehended together. In this stage, child caring will not be taken into consideration because, it is not a perfect routine hose tasks but only for ones with child. Second, shopping will be excluded because it doesn't show male participation into tasks but females' exclusion from public domains. Third, child care will be added into the table which shopping is excluded.

Table-55 with single items and table-56 with mean scores of constructs shows that male partners have obviously 'newer' participated into routine house tasks, except shopping and child caring. They have surely no less participation than they are declared in child caring. They have participated probably into child caring as part time play maid and supervisors when mamas have make routine house tasks. But, daddies have no places when baby bodies and dresses have been cleaning up. Unfortunately, males of industrial-working class city of Kırıkkale have less rates of participation into such tasks than the males of Ankara. Fortunately, they have began to enter into Kitchen to prepare something although they have no place after eating.

On the other hand, table-56 also shows significant differences among class locations considering males's participation into such tasks. In first construct, small employers and supervisors of Kirikkale and experts and casual workers of Ankara have seen as two basic locations of males who participated into tasks. However, small employers of Kirikkale lost their top rank when their grade on participation into shopping has been excluded. But all these four locations have still keep their places at top two ranks when shopping has been excluded. In other words, as a repetition, shopping can not an indicator of male participation into routine house tasks but it is

simple and indicator of females exclusion from public; if shopping will be evaluated within itself.

Last, experts have top grades when grades of males' participation into child caring have also been added into the total point. Experts hold the top in both cities in this last comprehension where small employers of Kırıkkale and casual workers of Ankara hold second groups. Also, capitalist and petty traders of Kırıkkale and petty bourgeoisie and petty traders of Ankara are the groups who have less participated into routine house tasks. However, these last distribution can not necessarily show non-democratic household structure; but it shows that petty bourgeoisie and petty traders have single employed families in general. Also, high level of males participation among casual workers of Ankara have also indicated that female partners have also casual works.

# 6. 1. 2. Female Participation into Decision Making

Level of participation of female partners into decision making process has also been accepted as an indicator of family types on modernization processes. Family types can be identified as a modern and democratic one if female's participation into decision making processes is higher enough. In order to decide on female position at decision making processes through three items, decision on visiting and guesting; paying or bringing credits, decision on general family budget (See table-57). Then they are combined into a kind of roughly structured scale as indicated in table-34.

At first, table-58 shows that only 3.2 % and 10.2 % of females have get dominance in family decisions in Kırıkkale and Ankara. Also, they have a kind of equality at 27 % and 51 % of females on decision making processes in both cities. Thus, 33 % and 62 % of females have a balance at families' decision making processes with respect generally to their husbands declarations. Within the frame of given conditions, class locations in which female partners have largest authority are capitalists, managers, small employers in Kırıkkale and managers, skilled workers and supervisors in Ankara.

These evidences are generally in conflict with the evidences of male participation into routine house tasks. In this context, I think either it is non-sense to believe in male partners' speech on females partners' position within family relations or some more items have to be identified in order to get decide on females authority in decision making processes. Also, it is possible that males get success on creating a moral-cognitive climate in which their authority have been legitimate

enough to shape a table of equality or balance. Nevertheless, we can also infer from above data that females have less integrated into their families in Kırıkkale than Ankara. In any locations, males have keep the power on decision making more than 50 %.

# 6. 2. On Religious Beliefs: Secular-Westernists vs Religious-Pan-Arabists

Religion has seen as a social fact of Durkheim which it has also be comprehended as an 'dependent variable.' It should not be understood as free from human beings given by out; but it should be understood as a human creature. It is a 'dependent variable' of peoples action; which has been created, accumulated and transmitted to present generation from older ones in a continuous process of production and reproduction in Marxian sense or construction and reconstruction in Bergerian sense. It is not only cognitive elements of 'strong ideology' but also social appearances of 'soft ideology' (Mardin, 1983b; 1992). Basic unit of observation for this study is not the religion in the form of strong ideology but soft one as possession of strong ideology by people on their daily routines. In other words, question is not to decide on how much respondents adequately behaves in accordance to strong religious commands; but it is simply how much they have been legitimized themselves under the traditional patterns of religious behaviors; and how persons have being diversified from each other by considering these traditional patterns.

### 6. 2. 1. Pessimistic Expectations

Within general frame of modernization theories in Turkey, there are two main contrasting arguments about role of religion i.e islam. First, religion, particularly as in the form of sunnite sect, major sect in Turkey, has been comprehended by Kemalist elites as the ideology of Ottoman Empire which has been abolishing at 1910s (Timur, 1993). As it is pointed above, religiosity of sunnite sect is the ideology of opposition for new republic. In fact, it is not only a strong ideology but also a soft one which has been modified into daily routines of people. Thus, elites of new republic have also a list of proposed behavior conceptualized under the name of secularism formulated generally on imitation of western or modern patterns challenging to what religion i.e. sunnite islam proposed. In short, for new republic, sunnite islam both as an ideology in itself and as a guide for both court, government, and daily life regulations have to be broken down.

## 6. 2. Optimistic Expectations

On the other hand, there are also some more optimistic opinions on islam. From the very beginning, successors of Ottoman bureaucracy, especially court i.e. sheria attempt to reformulate islam as

a better ideology for muslims (Ersoy, 1920) Western civilization is identified as the basic enemy of human kind. Integration of muslims as a whole is better than integration of Turks. New republic should not be limited itself by the goal of integration of Turks, defined either as native muslims of Anatolia or Turkish spoken people on all over the world in order to get success against western civilization. Breaking the channels with other muslim communities will also diminish power of new republic. This radical evaluation has no followers in Turkey due not only to muslims have been suppressed by Kemalist governments; but also muslims have no such goals, except Akif Ersoy who have died in an absolute poverty and loneliness. However, Present islam radicals who have defined themselves as rebellious against Westernism have seen still dependent upon either Persian or Arabian schools of thought, rather than Turkish ones.

At the second stage of growth of Turkish Republic, which may be identified by the years in between 1945es and 1960'es, islam has been began be to occupied to pick up votes by political parties at local and national elections. In this sense, islam has been comprehended as an integrative cement of Turkish Nation rather than as a challenge to western civilization but simply as an alternative to secularism of Kemalist governments. As it has been well formulated at later moments of time in Turkish political arena, secularism has

perceived as an expensive tool with respect to religion. Islam can also be hold as a disproportionately more cheap agent to control people. These kinds of opinions generally been cultivated and appropriated by right wing political parties rather than leftists.

There are also some academicians who have no explicitly declared political color but very critical on Kemalism who argues that suppressed sunnite islam by Kemalist elites as the real basis of democracy and modernization in Turkey. Kemalism with secular commands make ordinary people be alienated from governments and politics (Mardin, 1983b; 1992). In this contexts, various sects of sunnite islam have been flourished as the voices of majority of people under alienated rule of secularist Kemalism. Then, if the sunnite islam can not get political rule at own hands, there will be any democracy in Turkey. So, it is necessary to make islam be strong not only to make national integration be cheaper but also in order to get a final democracy.

In this second stage of growth of Turkish Republic there are also some optimistic formulations about islam among successors of Kemalism and socialism. In this frame of references, islam is comprehended as a democratic ideology in its core implicitly. Then, muslims have been invited into democracy if they want to be a real

islam. Although this kind of socialist formulations could not have popular basis among socialist communities; it could also be argued that some socialists have some enthusiasms in favor of some sects of islam, namely Alevilik and Bektaşilik. Also, alevis and bektaşis have articulated by themselves into democratic, Kemalist and socialist movements. Alevis and Bektaşis traditionally have most of secular behaviors what Kemalism have recently advised for the people.

However, these optimistic expectations have immediately been destroyed directly by muslims themselves. Hostility of sunnite islam have largely been oriented against alevis and socialists in Turkey. Thus, alevis began to be a non-islamic ideology. Recently, alevilik has largely been conceptualized as the islam of Turks in contrast of Arabic and Persian Islams (Arsel, 1993). Organized sunnite islam seem to have no activity on democratization whereas they have a lot of successes of assassinations in theory and practice. Then, It should be relatively valid question why these optimistic expectations on islam are strong enough besides historical falsifications. In my opinion, common characteristics of all pro-islamic opinions is their hostility against Kemalism and Turkish Revolution of 1923.

In this frame of references, sunnite islam is seen as the voice of people felt themselves as the social basis of right wing conservative

political movements; whereas non-religious persons who have been generally called as secularist (laikler) and alevis are the voices of people sat under non-conservative political movements. In fact sunnite religiosity has largely been flourished after rightwing political parties have took the political power. It has been well established especially after 1950'es and 1980'es in Turkey (Yücekök; 1971). Sunnite religiosity as it has declared itself at universities through young girl with 'turban' are not real continuity of traditional religion of Turks-Anatolians; but it is a kind of compulsive response of newly urbanized and probably less educated peoples to western way of life and political regime of 1980'es in Turkey.

But, free from question of how religiosity of sunnite or alevi Islams have been functioning on other spheres of human life; I will just look at correspondence between class locations and differences at religiosity where religiosity has been defined as soft ideology, patterned way of behaviors rather than as strong ideology, Kuran's commands directly; or cognitive and ideological formulations of 'mollas,' islamic fundamentalists.

### 6. 2. 3. Religiosity in Evidence

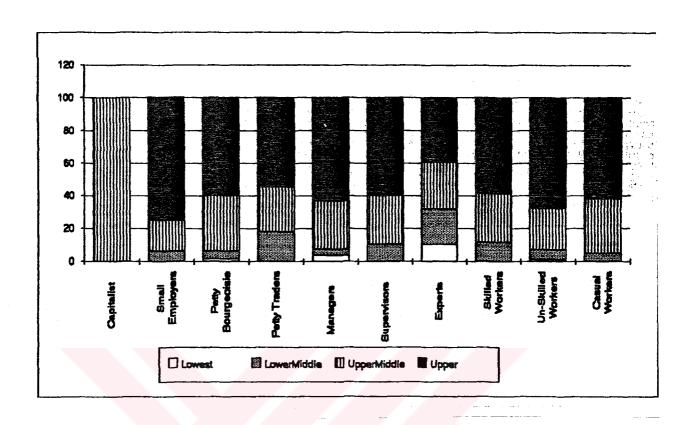

I have operationalized the concept of religiosity in two ways, that is for individual persons and for their family. On the other hand, islam have particularly different commands for males and females. Therefore, I have selected four items valid for both sexes, namely namaz, feast of ramadan, following religious publications and broadcastings. Second, I have added information about whether mother and fathers of respondents have prying namaz and feasting. Also, persons who are less religious should be comprehended as secular ones.

Table-59 shows an obvious condense on religiosity in Kırıkkale whereas there are negatively skewed curve in Ankara. In other words, there is no significant differences between class locations with respect to religiosity but all they are religious in Kırıkkale, except a few of experts. Most religious persons are belonging to the location of small employers, un-skilled workers, managers, casual workers, petty bourgeoisie, supervisors and skilled workers in Kırıkkale. Experts are the more secular group in Kırıkkale.

Graph-7: Religiosity of Respondents with Parents within
Class Locations in Kırıkkale

Graph-8: Religiosity of Respondents with Parents within
Class Locations in Ankara

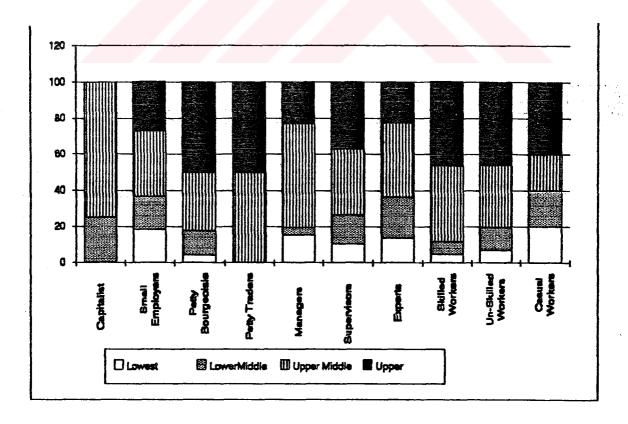

Table-60 shows religiosity of respondents at family level which consists of father and mother religiosity. It is interesting that number of persons belong to extreme group of religiosity has been lowered in Kırıkkale. In other words, parents are less religious than their children in Kırıkkale. They are largely been stayed at middle intervals of religiosity curve. A similar picture is also valid for Ankara; where persons at less religious group have been increased by taking parents into account. In my opinion, differences of religiosity grades of single respondents and families indicates that religious extremism or fundamentalism has no traditional social basis in Turkey. It is a new phenomena introduced to society either from above or below but surely from external areas.

# 6. 2. 3. 1. Religion as an External Pressure: Expectations for Children's Marriages

This externality has also been evidenced by parents' expected ways of marriages for their boys and daughters. There are sharp differences between parents' ways of marriage and their aspirations from children. However they have also different perceptions on their boys and daughters (table-61 and table-62). Majority of respondents would like to marriage by flirt to their boys in both cities. But, parents who prefer flirt for their daughters have share only of

approximately 38 % in Kırıkkale. It should also be pointed out that proportional weights of parents who declared their aspirations as religious way of marriages for their boys and girls has their maximum points at 6.4 % (for boy) in Kırıkkale. Parents who prefer religious way of marriage has lesser weight in city. I think that the differences between these two aspirations (like differences on aspirations of flirt for boys and daughters) indicates negative comprehension on females. Parents prefer marriage for his daughters in any kind, not necessarily religious, as they are also fearing that their daughters become a permanent old maid. The reason of negative preferences against flirt for girl is probably a comprehension which is commonly sharing in Turkey arguing that girl who have flirt is not good for marriage. In other word, if daughter have been labelled as such, she will probably be an old maid who have to be survived by the family members until the end of life. Because, she has generally get no employment opportunity. In other words, their future may be left into the hands of future husband and his family.

#### 6. 3. Conception on Children's Future

I will comprehend conceptions on children through five questions about expectations on boys' and daughters' educations and marriages; and conceptions on boys' and Daughters' shares of inheritances. Expectations for education can easily be evaluated from lowest to higher education. Expectations for marriages have been operationalized through the ways of religious, 'görücü usülü' (blindfold style) and flirt. Thus, I generated a table scaled reflecting parents expectations on their children as they are differentiated from lowest to highest ones with no hesitation on how much they are interrelated to each other statistically (See table-63).

Table-63 indicates that people of Kırıkkale have disproportionately lower expectations for their children than Ankara levels of expectations are probably lowest for daughters, as it has already been indicated in tables 61 and 62. This means that, people in Kırıkkale grow up their daughters with the traditional values. Only petty traders and casual workers of Ankara have lower levels of expectations for their children than the highest one in Kırıkkale. Also members of each class locations have relatively normal curves with respect to their expectation

on children. But experts have highest expectations for their children in Kırıkkale; as well as managers and supervisors have largely been skewed into positive expectations; whereas unskilled workers, skilled workers, small employers and petty traders have largely been stay at middle expectation groups in Kırıkkale.

#### 6. 4. Self Perception in Social Stratification

Self perceptions of respondent about their locations should be comprehended in a stratification model in contrast to Wright's model of class location. Categorization has been made on the open ended questions about their location in society in general which generate answers in any kind, from religious to economic perceptions. Respondents have used 42 and 31 different nominal categories in their answers in Kırıkkale and Ankara, respectively. I have used available categories for ordinal comprehension considering stratification model.

In this context, it is obvious that majority of people recognize themselves at moderate group in two cities. (See table-64) But persons also, people who recognize themselves at lower and higher groups ha than Kırıkkale. This is adequate to the fact that different patterns of income inequality in both cities. In other word, it looks like people have clearly in aware of income inequality; and their

perceptions on stratification have also been determined in accordance to income differences rather than class locations.

On the other hand, locations of small employers and petty bourgeoisie recognize themselves at higher level in Ankara whereas petty traders, supervisors, experts, skilled and unskilled workers have frustration which is obvious for experts. Managers and casual workers have began to see themselves as a more moderate position in Ankara also.

# 6. 5. Cognition on Most Important Social Problems

Cognition of most important social problems have been illustrated through responses given to an open ended question as it has been made on self perceptions. Conclusions have verify that majority of people have appropriated an economical reasoning. For people living in Kırıkkale important problems are poverty, pollution and inflation; for people living in Ankara pollution, unemployment and poverty respectfully.

But, it is also pointed out that Ankara residence has disproportionally more number of people indicates pollution as the most important problems. In other words, Ankara dwellers have questions formulated in much more narrowed local frame of reference whereas Kırıkkale have a strong nationalist recognition, which may be as a result of clientalism in Kırıkkale. Further evidences on recognition on basic social problems have been illustrated in Table-65. Differences among class locations have no significant importance considering members' recognition of social problems. This shows `collective consciousness' in urban places which may also give clues of peaceful social transformation.

#### 6. 5. Habits and Hobbies

Habits or hobbies in daily routines should also be considered to see personal differences at social relations i.e. individual's linkages to his/her environment. In this context, I will look at whether respondents go to holiday or not; and if they go, where they go; whether they read daily newspapers and weekly magazines; if they read, whether they have bought it or not. These items have been combined into a kind of scale as it is illustrated in table-66. Each level on scale means an occupied activity where lowest category contains persons who have no activity as such. In fact, these categories reflects cultural differences evaluated from local to national frame of references. Thus, I will intending to read each categories on table as the states of cultural development although I have no precise argument on issue.

Table shows 20.4 % and 17.5% of people have no activity in Kırıkkale and Ankara, respectively. People have a negative skeweness in Kırıkkale where approximately 39 % of total population have only a single activity which is also generally declared as reading newspaper. Proportional weight of similar persons is approximately 15 % fewer in Ankara. Also, persons among Kırıkkale urban dwellers have stay on middle of scale whereas majority of people have stay at category upper

Significance	0.001		0.001	

On the other hand, class locations have significantly different colors in both cities (See table-67). In Kırıkkale, petty traders, casual workers, unskilled and skilled workers largely condensed into middle and lower middle categories; although experts, managers and small employers have skewed into upper middle categories. In Ankara, casual

workers, petty traders have stayed at lowest group of daily activities with more than their half. Small employers are seen as most colorful persons with their skeweness towards upper categories in Ankara, where second and third groups are made of capitalists and experts.

Proportional rates of their attendance on some of very basic daily activities are indicated for both cities in table-68.

Table-68: Daily Activities on Selected Fields

	Rate of Recrea	tion on Selected I	ields	
	in Kirikkale	<del></del>	in Ankara	
	N	%	N	%
Cinema	15	3.5	57	11.9
Theater	20	4.7	67	13.9
Watching Football	88	18.4	108	22.5
Wedding	176	41.4	103	21.5
Picnic	162	38.1	178	31.2
Coffeehouses	113	26.6	110	22.9
Other	3(	7.1	193	10.3

Lowest rates of attendance on cinema should indicate that people satisfy their need for movies from TV at their home. Theater is less visible in Kırıkkale, where 4.7 % of people have declared

themselves that they are going to theater. In fact, they are going to plays staged by school students whom are probably their own children, at the end of educational semesters. Going to stadium to look at football matches have disproportionately more share than former hobbies in both cities which, shows sexual segregation on entertainment activities. Stay at coffee houses is also another way of segregated recreational activity largely shared in both cities. On the other hand, there are also recreational activities which are potentially not sex-segregational in both cases, namely going into wedding and picnic. Going into wedding and picnic are major ways of entertainment as they are declared in Kırıkkale. However, wedding ceremonies have largely been in sexually segregated spaces especially in Kırıkkale. Also, housewives probably used as picnic-wives in picnic areas.

Declared numbers of other ways of recreational activities have also evidenced that Kırıkkale have less colorful or dark than Ankara. There are only 7.1 % of people who are able to say that they have an additional way of recreation in Kırıkkale although 40.3 % of people have such ways in Ankara.

#### CHAPTER VII

#### CONCLUSION AND DISCUSSION

Class analyses which belong to the Marxist theory have some basic problems which are generated by their theoretical premisses. They have probably great influences over Wright's model of social classes (Wright, 1978; 1979; 1980; 1982a; 1982b; 1983; 1984; 1985; 1987; Wright and Hachen et. al, 1982; Wright and Martin, 1987; Wright and Perrone, 1977). As it is relatively well known, Marxism argues that human history was made up of successive stages each of which has its own unique economic base. The historical process of developed capitalist societies will have recurrences in all other 'underdeveloped' capitalist societies (Warren, 1980). These economic bases have generated their super structures which appeared mainly through cultural and political fields of life, which are mediated by class struggle. In this sense, human societies have been comprehended as a totality of these bases and super structures on a 'constructional analogy'. A society in certain stage has the unique class formation and class struggle of that stage (Giddens, 1971). These have been over-determined by economic bases. This is a kind of pessimist fatalism about human nature in which human development have

basically been comprehended as economic development i.e., development of human kind as a means of production. According to Marx and Engels:

production is treated as 'the first historical act' land the production and reproduction of material life is seen as the fundamental condition of all history, which today, as thousand of years ago, must daily and monthly be fulfilled merely in order to sustain human life (Abrams, 1982:35).

In fact, it is possible for one to engage in non-economic activities, such as artistic works but these are only valuable for human development as for economic development which is crystallized through class struggle. In this context, people can have only remedial influences over formations of social classes, societies, politics etc. They have no chance to intervene into the unfolding of historical stages. They can only work to delay or accelerate basic dynamics of these stages which have emerged out of economic relations (Ditomaso, 1982: Abrams, 1982:35-36).

These evaluations which have founded their scientific premisses in pragmatist philosophy and Darwinian theory of evolution reflect functional understanding of history and society (Weldes, 1989: 355).

Both lines of comprehension have argued that human history is full of

people's violent struggles against wild nature and barbarity. This is a very well evidenced economic reductionism (theoricism) which led Marxism to fall into some kind of theoretical obsession. This has blinded crude Marxism to perceive inhumanistic violence of capitalist expansionism across non-capitalist communities and non-capitalist sectors of capitalist societies. This also leads students of Marxism to neglect non-economic factors which may have influences over class formations (Lipietz, 1982: Lloyd, 1982). This is relatively important for Turkish communities in which class formations have largely been constituted under state regulations rather than autonomous forces which emerged out of economic bases of historical stages. Also Marxism seems to inhere some capitalism bias which is evidenced through its decisive obsession to ignore actors' role on class formations and cross-class relations. For example, it is one of the findings of the present study that there is no significant relation between class locations of spouses in Kırıkkale; This is true for the households where both spouses are working (Table-44). People from the same class locations develop friendships between themselves but having friends from other class locations is also quite common in Kırıkkale more than in Ankara (Table-45; Table-46; Table-47).

Evolutionary understanding of human history makes Marxism also be very particularistic, which is successfully appropriated by Weber's ideal types. Particularism makes it superfluous to generate concepts

which are reliable and valid for social analysis in the cases of diverged history and societies. Thus, Marxism makes it necessary to generalize descriptive categories as theoretically valid conceptual means of analysis. These categories require only to be tested for their adequacy in empirical analysis rather than to reproduce them with respect to new empirical evidences. There is no need for researchers to arrive at unexpected consequences and to generate new definitions of basic concepts. Theoretical boundaries of ideal types have already been determined by masters rather than by researchers who have dealt with empirical evidences. Thus, it becomes necessary to describe different categories for different historical and structural cases. This reflects not only a kind of antagonism but it also results in a theoretical segregation between capitalist and colonized communities, including academic communities of these two camps. Hence, each camp has to use necessarily different concepts in order to grasp their own conditions as it is indicated by Weber's terminology on social castes, status groups, etc. In this sense, any comparison has necessarily turns into a speech which describes what there is and what there is not. This approach prevents a real comparison. And then, Marxism has forced the people of underdeveloped societies to examine themselves with respect to their abilities to arrive at capitalism rather than to determine their own dynamics which make them to be influential over their own fortune.

Further questions have been generated out of insufficiencies of Marxist class conceptions as operational /analytical means of data collection, processing, analyzing and presentation. Wright's work is an attempt to remedy some of these insufficiencies, thereby generating a structured means of survey and presentation for Marxist school of thought. But, Wright has still confined himself within economic realities of advanced capitalist societies. Thus, Wright has fallen into the same shortcoming about one of the very basic insufficiencies of Marxist class conceptions which Carchedi (1977) has already pointed out. shortcoming is not being able to grasp social classes at the level of social formations. Furthermore, Wright has not attempted to develop theoretical concepts for grasping economic and non-economic structures in underdeveloped capitalist societies. Hence, his class analysis necessarily excludes a huge number of people due to the fact that they are totally unemployed and /unemployable such as housewives. These categories are not in fact leisure class, marginal, reserve army of labour, lumpens, underclasses etc. but they are something else. Total numbers of those 'unaccounted' family members has roughly made of eighty one and seventy five percent in Kırıkkale and Ankara respectively. Those persons increase the relative significance of households because they have already been cared for by the other members of households. In this sense, both heads of households and their 'dependents' have regarded themselves and each other mainly with respect to their positions in family networks rather than class locations.

Within certain limitations, it must be accepted that Turkish cities, under consideration, have some basic characteristics of advanced, forms of capitalist class society rather than pre-capitalist ones. Managers, supervisors and experts have composed 25 % of the total number of respondents in Kırıkkale and 25.4 % in Ankara. They make up of 52.5 % and 71.7 % of the total number of respondents in Kırıkkale and Ankara, respectively if we add numbers of capitalist and skilled and unskilled workers into their ranks (Table-5). These percentages become 81.9% and 78.7% of the total number of respondents if we consider small employers and casual workers as the people belonging to class locations of capitalist mode of production. It seems that women have been considerably excluded from labour market in both cities. Proportions of employed females are very low in both cities with Kırıkkale in fact having four times lesser number of female occupants than the total number of employed females in Ankara (See Table-11). Thus, distribution of female respondents within class location is significant for both cities but it is more significant for Kırıkkale which is observed as a city where females have almost been totally excluded from the labor market. Capitalists, petty traders and casual workers have no female members in Kırıkkale; whereas in Ankara only capitalists have no female members. capitalists in

Ankara. In other words, formal public organizations are seen as the basic avenue for the females to get an employment opportunity in both cities.

The low rate of working females in the labor market has also influences on class formation and social relations. Both processes of class and 'community' formations are largely realized among males. Females are necessarily confined into their 'homes' to cook, sew and to get involved in neighborhood relations and in family networks. This strengthens the estrangement/adversity between males and females. It makes the community like a 'male community' in which females have considerably been excluded from the decision making process of the household and from the public spheres, as in the case at the labor market (Table-57; Table-58). Indeed, it seems that females have no chance of going out the to marketing for the daily needs of their households in Kırıkkale. On the other hand, males seem to be totally 'exclude' themselves from routine house tasks (Table-55; Table-56). But it should be pointed out that the class location of experts lead in participation in those house tasks in both cities. Indeed, females have also been excluded from decision making processes in family networks in Kırıkkale whereas they can participate in such decisions in Ankara. However, it is hard to relate variations in participation to the level of exploitation which is identified by class locations.

Wright has also considered economy as a kind of relation of exploitation rather than property ownership, production, distribution, exchange and consumption which make sense for Marxist understanding of modes of production. Therefore, he lost his theoretical ability to grasp differences among workers employed in different sectors of the economy. Thus, conventional class model has necessarily fused some potentially different locations into each other which should be identified with their own class boundaries. Two of them are identified heuristically as casual workers and petty traders for two Turkish cities in which they have been determined by the lack of permanent work places. In fact, it must be pointed out here that, the category of petty traders has also included some small artisans who have worked with their own means of production, such as tinsmith, seller of meatball etc. Petty traders comprise 2.6 % and petty bourgeoisie has 15.5 % of the total population in Kırıkkale and they hold 1 % and 20.3 % of total the population in Ankara. On the other hand, casual workers make up 5.6 % and 2.5 % of total population in Kırıkkale and Ankara, respectively (Table-5). Their significance will increase if their weights are considered within the boundaries of small employers and working classes. They have probably softened the relations among social classes and then probably dispersed the growth of class consciousness (Akşit, 1978). Hence, in my opinion the permanency of work places which is one of the very basic indicator of people's relations with space (Beourdieu, 1985) should also be taken as one of the determinants of class locations (Brubaker, 1985).

Ownership has not been considered by Wright in his emphasis on exploitation although it is very important to consider forms of property ownership in order to grasp clientalist mechanisms of class formation which are generated by dominance of state ownership over economy. This is significant for both cases because public firms generate the disproportional larger amount of employment opportunities where public bureaucracy is seen as 'state class' (Keyder, 1987), which have not only appropriated capital accumulation but also allowed capitalist class formation under its own regulation (Boratav, 1982). So, class rights of capitalists and labour classes have been 'defended' against each other by 'father state' rather than allowing a free struggle. Thus, members of working class, as it is more obvious in the case of Kırıkkale, have strictly absorbed clientalist discourses and mechanisms rather than generating their autonomous mechanisms and discourses of class formations.

Indeed, state ownership may generate a kind of tributary economy in Turkey (Boratav, 1980:15) where income differences can be significant to determine people's places in class locations besides property ownership and means of production. According to the findings of the present study most of the class locations have both poor and rich

members within themselves in both cities, except petty traders and casual workers. Skilled workers and experts have also no rich members in Ankara (Table-19; Table-20; Table-21). It should also be noted that average income of experts is more than those of supervisors; and supervisors have more income than managers in Kırıkkale where proportional rate of rich wage workers is considerably more than the same rate in Ankara.

In this sense, Kırıkkale is more suitable for the development of clientalist mechanisms in order to increase their income more than the local people of Ankara; because public firms are main employers in Kirikkale where proletarianization has largely been materialized in the public firms (Table-6). Indeed, as it has partially been mentioned before, a huge amount of people are unemployed in both cities and this is more vital in Kırıkkale. Unemployment is a more critical problem for the young in Kırıkkale where the household have regarded themselves as obliged to provide employment for their children. Thus, they are inclined to generate institutional mechanisms of favoritism or nepotism when they seek for 'torpil' and 'rüşvet' to get hold of a regular employment for young generations. In this frame of reference, employed persons are also inclined to invigorate same mechanism for the promotion and solution of any other work-related difficulty. In this context, as it will be mentioned later, local people of Kırıkkale worries lees about unemployment as a

Table-65 the problem of unemployment is ranked as the fifth in Kırıkkale which is ranked as the second in Ankara.

In fact, there are more persons who have secondary sources of income in Kırıkkale. Thus, they have more autonomy to manipulate institutional mechanisms for their own particular benefits. Thirty eight percent of all residents (160 persons) have secondary sources of income in Kırıkkale (Table-22). Those sources of income have increased considerably in urban areas as a result of their personal savings invested into the urban fields although some of the additional sources of income have still been in rural areas as their inheritance. Investments in urban areas make an individual a kind of speculator who has benefitted from increase in costs of land and building estates through urbanization. Indeed, they actually support conditions which increase the 'rent' of their houses in rent where a considerable number of people accommodate in their own houses.

In this sense, most of the respondents of various class locations in Kırıkkale have precisely agreed that political parties should basically be functional for practical purposes of individuals and communities rather than for the future endeavors of abstract subjects, like society or humanity. This is more apparent among intermediary class locations of

experts, supervisors, skilled workers and managers. These class locations have been considerably associated with political parties although they have no political i.e. social needs to be in politics (Table-54). Clientalism is also prevalent within trade unions. Most of the working class members see trade unions as means for their personal supplementary economic benefits rather than for any improvements in their main wages as well for any other social or political intentions. That is to say, they believe that they have very little control over their main wages which are determined mainly by governments. And then, they look for subsidiary ways to increase their wages by an opportunist approach.

The Marxist model is also insufficient to consider historical background of clientalism which has been realized through cross-class and spatial mobility. It is not enough to comprehend class formation just by explorating members' class locations within the class structure. It is also necessary to determine the distinction between their present locations and their parent's locations. This may make the relationship between class locations and class formations arbitrary because a considerable number of parents had been farmers in small scale lands in the villages. This can also be verified with the fact that most of the urban people distributed through different class locations have migrated from rural areas in both cities. Thus, employed urban residents may have been considering their life histories as full of improvements as well as they

have seen social structure as full of chances for the coming generations. Hence, a kind of pragmatism involving some fatalism has grown up reflecting persons' self-reliance rather than their belief in God. They don't hesitate to get their rewards if they have strived enough. Then, there is nothing to do for them than waiting for their rewards. They are seen as people hopeful for their future as well evidenced in their participations in politics and trade unions although military coups deemed such participations somehow dangerous.

In this context, there are in fact two additional lines of social 'groupings' (Lloyd, 1990) besides class formations. First of all, urban people started grouping with each other with respect to their duration of residences in surveyed territory as natives and strangers i.e. migrants (Baştuğ, 1979; Ayata, 1987); and secondly, they began to come together with respect to their original hometowns. In this sense, migrants /strangers have began to be diversified into two sub-groups, one composed of migrants who have come from surrounding hinterland and the other consists of migrants from other territories. However, first group of migrants have also considered themselves as natives rather than migrants. Therefore, I belive that migrant strangers have not been divided into two sub-groups within themselves but natives have been divided as real natives and migrant natives in Kırıkkale and Ankara (Table-37). Thus, the social relations among these groups are mainly formed under the affects

of this categorization. This is more apparent in Kırıkkale which has a lower number of real native residents. The real natives make up 6.8 % of total population whereas the migrant natives share in the population 48.7 %; The real migrants/strangers' proportion in the total population, on the other hand, is 44 % in Kırıkkale. These percentages for Ankara are 22.8 %, 0.84 % and 76 % respectively which represent very different picture of composition of residents in Ankara. As a result migrant natives have to produce a formal definition of nativeness to satisfy their alliance and to produce their identities. Thus, they have begun to define 'others' i.e. migrants especially real migrants as their opponents. On the other hand, significance of such distances between natives and others does not have much sense, because, from observer perspective a disproportionately huge number of people are truly migrants (real and migrant from the hinterland) composing 92.7 % of the population.

Social differentiation among natives and migrants have also been enhanced in two other ways. First, candidate political representatives have basically attempted to associate migrant natives and real natives as their own stock of votes. Second, natives have also negotiated with these leaders for their votes to satisfy their particular warranties. As a result, political leaders define nativeness differently in different contexts in accordance with their political interests. In fact, ordinary people have largely been influenced by unemployment of their

sons where public firms have provided basic way of employment which are under the control of political leaders. In other words, class models should also consider characteristics of respondents' family members if they want to be beneficial in grasping several social actors.

Considering economy as kinds of relations of exploitation rather than as a system of relations in which various processes of productive, distributive and similar activities realize leads the class analysis to neglect class locations which have been generated from sectoral distinctions. In this context, Wright's class model has necessarily confused office workers and casual wage workers with each other on various fields of economic under the term of unskilled wage workers because both of them have no occupational skills. Indeed, differences between these two groups also largely corresponds to educational differences in Turkey. differences Wright's present model of class analysis also ignores the between mental and manual labor; to which Goldthorpe (1980) and Poulantzas (1975; 1977; 1983) pay more attention. For example, his model argues that managers have more education than supervisors, experts and other wage workers; and supervisors too have more education than experts; and experts have more education than the rest of the employees. But, there are some managers and supervisors without formal educational diplomas according to the findings of present study (Table-17). They have lower levels of education than their lower status workers. They have probably hold such places in division of labour because of their informal ties in patronage relations. However, these inconsistencies will also make the inner-clashes of working class more significant for the future prospects rather than dwelling on the movements of mental and manual labour. Thus the trade unions may have to act for the benefits of those managers, supervisors and other admired employers because they have also respectful positions in those organs as they have in work places.

In fact, as it has been underlined by Poulantzas under the term of 'political power,' (Poulantzas, 1978) social classes should be identified in order to explain something rather than to register miscellaneous details of social reality. (Poulantzas, 1977, 1983) In this sense, Wright's class categories (with few modifications) have undoubtedly less explanatory power about some more superstructural formations occurring in surveyed cases. For instance, class locations have not significant differences with respect to their relations with religiosity, actual ways of their marriages, aspiring ways of marriages for sons and daughters, future expectations for their children in general, perceptions of most important social problems, daily habits and hobbies. All members of all social classes seem to be religious persons, except experts especially in Kırıkkale where informal social control mechanisms have a considerable weight (Table-59). Respondents commonly had been commonly been married according to

their parents' advises in 'görücü usulü' (blindfold style). More precisely eighty four percent of residents in Kırıkkale and sixty five percent of residents in Ankara have been married in this way (Table-16). However, they have intend to give their boys the freedom to marry according to their own choices; whereas they want to have their daughters married according to the 'görücü usulü' (blindfold style) with no considerable distinction among class locations (Table-61; Table-62).

Class locations do not show any considerable differences from each other on their expectations about their children's futures. It should also be pointed out that they have undoubtedly lowest ratios of expectations for their children in Kırıkkale whereas members of all class locations have considerable higher expectations in Ankara (Table-63). This may be due to the expectation differences concerning boys and girls. Local people of Kırıkkale have no intention for making their daughters's future better as opposed to their sons. They may be leaving their daughters futures into the hands of future husband and his family.

Class locations have also no considerable differences with respect to their conceptions of most important social problems. They argue that environmental pollution and poverty are the basic social problems but more in Ankara than in Kırıkkale (Table-65). Class locations have also no considerable differences with respect to their daily habits

and hobbies, particularly in Kırıkkale (Table-66; Table-67; Table-68). In fact, class locations have began to have different daily habits and hobbies i.e., life styles in Ankara whereas they have not any habits and hobbies worth mentioning in Kırıkkale.

On the other hand, class locations have been seen as considerably different from each other with respect to their self-perceptions in social stratifications in both cases (Table-64). However, with the exception of experts, the majority of persons in Kırıkkale are inclined to see themselves in lower statuses than the statuses they hold in reality. For instance, a considerable number of employers have declared that they are in a middle rank in stratification. However, residents of Ankara perceive their own and other's places in stratification more clearly.

Class categories have considerable ability to explain some relatively more economic and structural aspects of human life, such as, income, house ownership, level of rent, types and quality of houses, etc. although they have less ability to grasp most of the superstructural occurrences. Income inequality among class locations is more visible in Ankara and it is still a reality in Kırıkkale. Capitalists have 8.5 times more income than the lowest income group of casual workers in Kırıkkale whereas capitalist have 73.5 times more income then the lowest income

group of petty traders (Table-19). As it has partially been mentioned, most of the local residents have their own houses (Table-23). Seventy two percent and 61.4 % of urban residents have their own houses in Kırıkkale and Ankara respectively. House ownership as a characteristics of 'underdeveloped' societies is seen as an end in itself for both cases. However, unskilled workers and petty traders are two poles in house ownership in Kırıkkale where 82 % of unskilled workers have their own houses whereas 45 % of petty traders have their own houses. Experts are also seen as the class location with lower numbers of house owning members in both cities. Costs of rents seem to be different for different class locations in both cities (Table-25). Capitalists are accommodated in houses with highest rent values whereas petty traders and casual workers stay in lowest value houses in Kırıkkale and Ankara.

Class locations also seem to be distinct from each other with respect to the some other structural aspects, such as, building and living standards. Capitalists, small employers, petty bourgeoisie, managers and supervisors have no members who reside in lower standard houses in Kırıkkale whereas capitalists, small employers and petty traders have no members who live in houses with the same low standards in Ankara (Table-27). On the other hand, capitalists, managers, petty bourgeoisie have higher living standards in Kırıkkale and capitalists, small employers

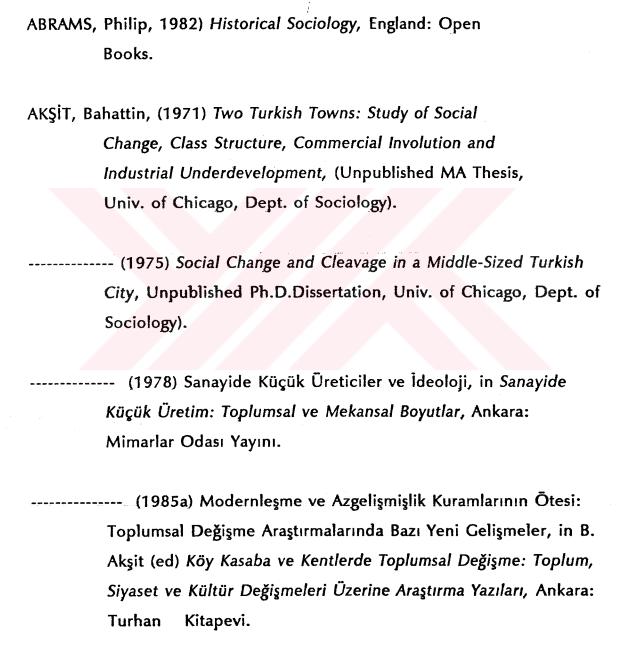

and managers hold the same positions with respect to the same living standards in Ankara (Table-35).

However, in this frame of references, I belive that any explanation about relationship between class locations and structural and superstructural entities can also be interpreted as arbitrary consequences. Because, class analysis have already neglected 'other factors' which may have probable influences over the same occurrences. I also belive that, the present study seems to prove the need for an alternative way of determining class categories to grasp the social realities with all dimensions. In this context, basic characteristics of an alternative model for social class analysis can be summarized as follows:

- 1) It has to have no reductionist pre-occupations about what social classes and any other social groups are, such as working class, bourgeoisie, feudal, religious etc.
- 2) It has to identify its unit of analysis in a given social formation at a given moment of historical time rather than non-historical categories of capitalist mode of production, social formation etc.
- 3) However, class conceptions have to assert universal validity for different cases in history and society. Class formations and consequent compositions with all their varieties can be studied by the same class constructs.

4) In this context, by following Carchedi's (1970) very brilliant emphasis on the necessity of economic identification of social classes i.e. definition of social classes as a dependent variable at first rather than social identifications of economically constructed categories, I propose to define social class as a 'social groupments' of Gurvicth (Bozkurt, 1972) or social groupings which view all relations and social networks as the subject of analyses of groupings (Lloyd, 1990) or 'groupforming practices' which deny similar dispositions and interests and therefore similar production of similar practices from people who occupy similar positions (Bourdieu, 1985: 725). Otherwise it is a 'class on paper' which has only a theoretical existence and has no space in the real sphere of relationships (Bourdieu, 1985: 725).

APPENDIX

Sayın Cevaplayıcı,

Uluslararası bir projeyle bağlantılı olarak gercekleştirilecek bu araştırma, "Sanayileşme, Toplumsal Değişme ve Hanehalkı Yapısı" arasındaki ilişkiyi incelemeye yöneliktir.

Bu ankete verilecek cevaplar tek tek kişilere göre değil, bilimsel teknikler aracılığı ile, topluca analiz edilecektir. Bu nedenle ankete samimiyet ve içtenlikle cevap vereceğinize inanıyor, bu araştırmaya yardımcı olacağınızı umuyoruz.

Şimdiye kadar 12 ülkede yapılmış Sanayileşme ve Toplumsal Değişme konulu bu araştırmayı, ODTü'den bir grup öğretim üyesi ve Ankara üniversitesin'den Araştırma Görevlisi Hayriye Ebaş tarafından yürütülmektedir. Araştırma resmi makamların bilgisi dahilindedir. Bu araştırmada, cevaplayıcı olarak sizin isminiz muhtarlık listelerinden tesadüfen seçilmiştir. Şimdi ise, sizin hanenizden kiminle görüşüleceği, sizin de katılımınızla gene tesadüfen seçilecektir. Ancak bunu yapabilmek için haneniz hakkında biraz bilgi sahibi olmamız gerekmektedir, yardımlarınıza seviniyor ve şimdiden teşekkür ediyoruz.

Araştırma Grubu Başkanı Doçent Doktor Yakın Ertürk ODTü, Sosyoloji Bölümü Uğretim üyesi

  1() Hayır 2() Evet ----> (soru 33'e git)
- 17. Ankara'ya nasıl geldiniz/gelmişler?
  - 1( )Annem babamla birlikte geldim
  - 2( )Bekar olarak geldim
  - 3( )Evliydim eşimi ve çocuklarımı memlekette bırakıp geldim
  - 4( )Evliydim çocuklarımı memlekette bırakıp eşimle geldim
  - 5( )Evliydim cocuğumuz yokken eşimle geldim
  - 6( )Eşim ve çocuklarımla geldim
  - 7( )Başka
- 18. Siz/aileniz Ankara'ya nereden geldiniz /gelmişler 11:........

19.	Neresinden? 1() Kent merkezi 2() ilçe:
20.	Hangi yıl geldiniz / gelmişler ?
21.	Ne sebeble geldiniz / gelmişler?  1( ) İş amacıyla 2( ) Çocukların eğitimi  3( ) Yurt dışından kesin dönüş 4( ) Kendi eğitimi için  5( ) Tayin 6( ) Yurt dışından göç  7( ) Başka
22.	Neden başka bir yer değil de Ankara'ya geldiniz/gelmişler?
23.	Toplam olarak Ankara'da oturma sürenizi yıl olarak belirtiniz?
24.	<pre>flk geldiginizde / geldiklerinde hangi mahalleye yerleştiniz/ yerleşmişler?</pre>
25.	Kaç yıldır şimdi oturduğunuz mahallede oturuyorsunuz?
26.	Akrabalarınızdan Ankara'da yaşayan var mı? 1() Var 2() Yok
27.	Varsa, kimler 1() Diger aile üyeleri 2() Akrabalar 3() Hemşehriler 4() 1+2 5() 1+3 6() 2+3 7() 1+2+3 (hepsi)
28.	Ankara'ya gelmeden önce ailenin temel geçim kaynağı neydi/neymiş?
29.	Ankara'ya gelmeden önce siz geçiminizi nasıl sağlardınız?
	Memleketinizle ilişkiniz devam ediyor mu?  1() Evet 2() Hayır ——> (33' e git)
31.	Nasıl, belirtiniz: 1( ) İlşki devam ediyor, maddi manevi destek yok 2( ) Manevi destek (düğün, bayram, akraba ziyareti) 3( ) Kendisi, akrabası yada ortakçı tarafından işletilen toprağının olması 4( ) Toprak ve akrabasının olması( maddi-manevi destek) 5( ) Maddi yardım alması (un, bulgur, ekin vb.) 6( ) Başka, belirtiniz:
32.	Memleketinize ne kadar sıklıkla gidersiniz?  1( ) Haftada bir 2( ) Ayda bir  3( ) Altı ayda bir 4( ) Yılda bir  5( ) Cok nadir

***	Herkese sorulacak
33.	Su anda Ankara'da yaşamanızın en önemli nedeni nedir?  1( ) İş olanağı 2( ) Evinin olması  3( ) Akraba yada tanıdıklarının olması 4( ) Rahat yaşayabilmesi  5( ) Ucuzluk 6( ) Gidecek başka yer olmaması  7( ) Lojman veriliyor olması 8( ) Tayin  9( ) Başka,
34.	Başka yere (Yurt içi/ Yurt dışı) göçmek istermisiniz?  1( ) Evet 2( ) Hayır ——> ( 37'ye git)
35.	Evet ise, nereye? 1() Yurt dışına 2() Memleketime geri dönmek isterim 3() Nereye olursa, iş bulduğum her yere 4() Sahil kentlerine, sahilde bir yere 5() Sessiz, sakin, dinleneceğim bir yere 6() 4+5 7() Başka, belirtiniz
36. 1	Neden? 1() Türkiye'yi sevmiyor 2() İş olana <b>g</b> ı
	3() Geçim şartları, ucuzluk 4() Sosyal şartlar, eğitim, sosyal hizm. 5() Sahil kenarı 6() Sessiz sakin bir yer 7() Daha önceden bildiği bir yer 8() Ankara'yı sevmiyor 9() Müslüman memleket 10() Akrabalarıyla aynı yerde olmak için
	GURUSULEN KISININ GEÇMIŞINE İLIŞKIN BILGILER
37.	16 yaşınıza kadar size kim baktı? Lütfen yakınlık derecesini belirtiniz:
	Size bakan kişinin doğum yeri? 1( ) Metropoliten kent merkezi 2( ) Kent merkezi 3( ) 1lçe merkezi 4( ) Kasaba 5( ) Köy 6( ) Başka, belirtiniz
	Size bakan kişi, hep aynı işi mi yoksa, farklı işler mi yaptı?  1() Aynı işi  2() Farklı işler ——> (47'ye git)
40.	Yaptıgı iş?
41.	Size bakan kişinin çalıştığı kurumun/alanın özellikleri nelerdir; çalıştığı yer ne üzerine, ne üreti!mekte, yapılmakta veya dağıtılmakta?

42.	Kendi işinin sahibi mi yoksa başkasının işinde mi çalışırdı?  1() Kendi işinin sahibi 2() Başkasının işinde> (45'e git)
43.	Yanında ücretli olarak kimseyi çalıştırıyor muydu? 1() Evet 2() Hayır
44.	Kaç kişi?kişi
45.	Başkalarının işinde çalışıyor idiyse, yönetici konumunda mıydı? 1() Evet 2() Hayır> (52' ye git)
46.	Evet ise, belli başlı görev ve sorumluluklarını anlatır mısınız?
47.	Size bakan kişi farklı işlerde yaptı ise, çoğunlukla kendi işinde mi yoksa başkalarının işinde mi çalışıyordu?
	1() Kendi işinde
48.	Bu kişi, daha çok kendi işinde çalışıyor idiyse, yanında ücretli olarak çalıştırdığı kimse var mıydı? 1( ) Vardı 2( ) Yoktu, sadece kendisi çalışırdı
49.	Bu kişi, daha çok başkalarının işinde çalışıyor idi ise, yönetici konumunda mıydı 1() Evet 2() Hayır ——> (52'ye git)
50.	Evet ise, belli başlı görev ve sorumluluklarını anlatır mısınız?
51.	Hem kendi hesabına hemde başkalarının işlerinde çalışıyor idi ise, kendi hesabına çalıştığı işlerde mi daha çok çalıştı; yoksa başkalarının işlerinde mi daha çok çalıştı?  1( ) Çoğunlukla kendi işinde 2( ) Çoğunlukla başkalarının işinde
* * *	(Bakan kişi anne ise sorulmayacak)
52.	On altı yaşına kadar anneniz ücretli olarak; yada aile işinde ücretsiz olarak çalıştımı? 1() Evet 2() Hayır 3() Annem yoktu
53.	Evet ise, ücretli olarak mı; aile işinde mi çalıştı?  1( ) Kendi işinin sahibi
54.	ücretli olarak çalıştı ise; esas işi ne idi? (Genellikle yaptığı işi

	YAPILMAKTA OLAN SON İŞLE İLGİLİ AYRINTILI BİLGİ
55.	Asıl mesleğiniz?
56.	Su anda yaptığınız iş?
57.	Çalıştığınız yer ne üzerine, ne üretilmekte, yapılmakta veya dağıtılmakta? (Kamu mu özel sektör mü?)
58.	1ş durumunuz aşagıda verilenlerden hangısine uyar;başkasının hesabına mı, kendi hesabınıza mı yoksa aile işinde veya tarlasında ücretsiz mi çalışmaktasınız?  1( ) Belli bir ürün üretmekte, dağıtmakta veya hizmet sunmaktayım (Business or service)  2( ) Serbest meslek sahibiyim ( belli bir iş dalı pratiği :professional practice)  3( ) Tarımla uğraşmaktayım  4( ) Aile işinde veya tarlasında ücretsiz çalışmaktayım  5( ) Başkası hesabına çalışıyorum
	6( ) Başka,
59.	Kendi işinizin sahibi olmayı mı başkası adına çalışmayı mı tercih edersiniz? 1() Kendi işinin sahibi olmayı 2() Başkası adına çalışmayı
	Kendi işinin sahibi olmayı tercih ediyor ise, en önemli nedeni?  1() Başkasından emir almaktan hoşlanmıyorum 2() Daha çok para kazanırım 3() Daha saygın olurum, itibar görürüm 4() Topluma daha yararlı olurum 5() Başka belirtiniz,
61.	Şimdi yapmakta olduğunuz esas işinize ne zaman başladınız? Başlangıç ayı ve yılını belirtir misiniz? ay:; yıl:
62.	<pre>fşinizi bulmada/kurmada kim/kimler yardım etti? 1( ) Aile üyeleri</pre>
63.	Bu yaptığınız işi yapan akraba yada hemşehriniz varmı? 1() Evet 2() Hayır
64.	Varsa, kimler?  1() Birinci dereceden akrabalar (Anne, baba, kardeşler, eşi ve çocukları)  2() İkinci dereceden akrabalar (dayı, hala, teyze, amca, büyükbaba, büyükanne vs.)  3() Uzak akrabalar  4() Hemşehriler

# KENDI 151NIN SAHIBI OLANLAR VE AILE 151NDE ÜCRETSIZ ÇALIŞANLARA SORULACAK

65.	İşinizi kurarken/yürütürken herhangi bir yerden kredi/borç aldınız mı? 1() Evet 2() Hayır ——> (68'e git)

## ANKETORUN DOLDURACAĞI BÖLÜM

Mahallenin adı:
Anketi yapan:
Anketin yapıldığı gün:
Anketin tamamlanma süresi:
Ankete herhangi bir karışmanın olup olmadığı:
Karışma olduysa, kimlerin nasıl karıştığı:
Anketin yapılışı sırasında kesintiye uğrayıp uğramadığı:
Kesintiye uğradı ise, neden ve ne kadar sürelerle kesildiği :
Anket yapılırken, anketin yapıldığı yerde bulunanlar kimlerdi?
Anketörün görüşleri: Anket yapılan kişi hakkında:
Görüştüğünüz aileyi, toplumsal ve ekonomik özellikleri açısından açıklayınız; önemli gördüğünüz noktaları aktarınız?
Görüştüğünüz kişi/aile görüşmeye nasıl bir yakınlık ve istekle katıldılar?
***************************************
Tekrar görüşmeyi kabul ederler mi?
Ne kadar istekle tekrar görüşmeyi kabul ederler?

#### **CURRICULUM VITAE**

Hayriye Erbaş was born in 1958. She has graduated from Department of Sociology of Faculty of Letter in Ankara University, in 1982. She has achieved the degree of Master of Sociology from METU, with a thesis on "Social Relations and Attitudes Towards Works among Industrial Workers." She has been working as a research assistant in department of sociology Ankara, since 1984. She teaches the courses about "contemporary sociological theory" and "industrial sociology." She has also translated Margaret Poloma's book, "Contemporary Sociological Theory," (1978, MacMillan) under the name of "Çağdaş Sosyoloji Kuramları" (1993, Ankara: Gündoğan Yayınları). She has also participated into survey researchers other than his own Dissertation at various stages of work.
