January, 1993

T.C. YÜKSEKÖĞRETİM KURULU  
DOKÜMANTASYON MERKEZİ

Approval of the Graduate School of Natural and Applied Sciences.

Prof. Dr. Alpay Ankara  
Director

I certify that this thesis satisfies all the requirements as a thesis for the degree of Doctor of Philosophy.

Prof. Dr. Rüknettin Oskay  
Chairman of the Department

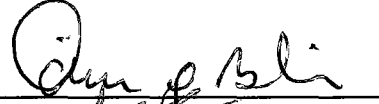

We certify that we have read this thesis and that in our opinion it is fully adequate, in scope and quality, as a thesis for the degree of Doctor of Philosophy in Mechanical Engineering

Prof. Dr. O. Selçuk Yahşi  
Supervisor

Examining Committee in Charge

## ABSTRACT

### A CYLINDRICAL SHELL WITH A FIXED END CONTAINING A CIRCUMFERENTIAL PART-THROUGH OR THROUGH CRACK UNDER THE GENERAL LOADING

GÜLGEÇ, Müfit

Ph.D. in Mechanical Engineering

Supervisor: Prof. Dr. O. Selçuk YAHSI

January, 1993, 183 pages

In this study, the problem of a cylindrical shell with a fixed end containing a circumferential part-through or through crack under the general loading is analyzed. The problem is formulated for a specially orthotropic material by using Reissner's shell theory. The part-through problem is treated by using a line-spring model. By using the Fourier integral transform technique, the problem is reduced to five simultaneous singular integral equations. The system of singular integral equations is further reduced to a system of linear algebraic equations which is solved numerically by using Gauss-Chebyshev quadrature formula. The primary objective is to study the effect of the end constraining on the stress intensity factor which is the main fracture mechanics parameter. Also, the effect of the shell curvature and thickness, material orthotropy, and the Poisson's ratio on the stress intensity factors are investigated.

**Keywords:** Cylindrical Shell, Circumferential Part-Through Crack, Circumferential Through Crack, Fixed End.

**Science Code:** 625.03.02

## ÖZ

### GENEL YÜKLEMENİN ETKİSİNDE BİR UCUNDAN SABİTLENMİŞ KISMİ ÇATLAK VEYA ÇATLAK İHTİVA EDEN SİLİNDİRİK BİR KABUK

GÜLGEÇ, Müfit

Doktora Tezi, Makina Mühendisliği Anabilim Dalı

Tez Yöneticisi: Prof. Dr. O. Selçuk YAŞI

Ocak, 1993, 183 sayfa

Bu tezde, genel yüklemenin etkisi altında, bir ucundan sabitlenmiş ve çevresel kısmi çatlak veya çatlak ihtiva eden silindirik bir kabuk incelenmiştir. Problem, özel ortotropik bir malzeme için Reissner Kabuk Teorisi kullanılarak formüle edilmiştir. Kısmi çatlak problemi line-spring modeli kullanılarak çözülmüştür. Fourier integral dönüşüm tekniği kullanılarak, problem beş tekil integral denkleme indirgenmiştir. Tekil integral denklemleri daha sonra lineer denklem takımına indirgenmiş ve Gauss-Chebyshev integral denklemi kullanılarak sayısal olarak çözülmüştür. Bu çalışmada asıl amaç, sabit ucun ana kırılma mekaniği parametresi olan gerilme şiddeti çarpanına olan etkisini incelemektir. Ayrıca, kabuk eğriliğinin ve kalınlığının, malzeme ortotropisinin ve Poisson oranının gerilme şiddeti çarpanına etkisi de incelenmiştir.

Anahtar Kelimeler: Silindirik Kabuk, Çevresel Kısmi Çatlak, Çevresel Çatlak, Sabit Uç.

Bilim Dalı Sayısal Kodu: 625.03.02

## ACKNOWLEDGEMENTS

I would like to express my deepest gratitude and appreciation to my supervisor Prof. Dr. O. Selçuk Yahşi who inspired and encouraged me in completing this study.

I wish to extend my special thanks to Prof. Dr. Yucel Ercan and Prof. Dr. Ali Durmaz for their invaluable support and encouragement.

I am thankful to my friend Dr. Levend Parnas for his cooperation in discussing and writing this dissertation.

I wish to express my deep sense of gratitude to my parents for their lifelong care and devotion.

I am especially thankful to my wife, Sema, for her long support and encouragement during the years.

To my lovely daughter, *Sila*

## LIST OF SYMBOLS

$q$	Surface loading
$N_{ij}$	Membrane resultants
$M_{ij}$	Moment resultants
$V_i$	Transverse shear resultants
$\epsilon_{ij}$	Strain components
$X_i$	Rectangular coordinates
$Z(X_1, X_2)$	Equation of middle surface
$U_1$	Displacement component in $X_1$ - direction
$U_2$	Displacement component in $X_2$ - direction
$W$	Displacement component in $X_3$ - direction
$\beta_i$	Angle of rotation of normals to shell surface
$F(X_1, X_2)$	Stress function
$h$	Shell thickness
$D$	Bending stiffness of shell
$B$	Effective shear modulus
$E, \nu$	Material constants for specially orthotropic shell
$c$	Orthotropy parameter
$R$	Radius of shell
$a$	half of crack length
$\Omega, \Psi$	Unknown auxiliary functions
$\lambda_2$	Shell parameter
$l'$	Distance between crack and circumferential crack
$m_j, n_j$	Roots of characteristic equations
$R_j(\alpha), S_j(\beta), A_1(\alpha),$ $A_2(\alpha), B_1(\beta)$	Unknown functions
$F_{j0}$	Known crack surface loads
$G_j$	New unknown functions defined in terms of derivatives of displacement quantities
$q_i$	Fourier transform of $G_j$

$\tau, \eta, \rho$	Normalized quantities used in numerical integration
$k_{ij}$	Fredholm kernels of singular integral equations
$h_i(\tau_j)$	Unknown fundamental functions
$\sigma_{ij}$	Stress components
$k_j$	Stress intensity factors
$F_i$	Net ligament force resultants
$G$	Energy available for fracture along the crack front
$U$	Work done by external loads
$V$	Strain energy
$\delta_i$	Relative crack surface displacements and rotations corresponding to the resultants
$r$	Radial distance from crack tip
$l_0$	Maximum depth of semi-elliptical part-through crack
$\xi$	Ratio of crack depth to shell thickness
$C_{ik}$	Coefficients of compliance functions

## CHAPTER I

### INTRODUCTION

Pressure vessels, pipelines, containers, ship hulls etc. are all shell like structures which may fail by fracture. The designers of these components must take this into account as such failures are often catastrophic and endangering lives and the environment. The fracture process typically starts with a small material defect or weld imperfection that grows in fatigue which is driven by mechanical or environmental conditions. Eventually the flaw may be characterized as a macroscopic surface crack. This surface or part-through crack then continues its growth through the thickness, leading to failure by leaking or an unstable fracture.

In the discipline of fracture mechanics, one usually assumes an initial flaw configuration, and then seeks to obtain certain fracture parameters that are believed to govern the tendency of crack to grow. In the case of brittle fractures and more importantly, fracture by fatigue, the stress intensity factor is the most commonly used parameter.

Up to now, fracture mechanics research as applied to cylindrical containers and pipelines has dealt mostly with longitudinal flaws in the component. There is, of course, a good reason for this, namely, in pressurized cylinders under normal operating conditions, the hoop stress is by far the dominant stress component. On the other hand, any secondary load caused by known and unforeseen factors would be primarily in the axial direction. Some of the sources of these stresses are support misalignment, variety of thermal fluctuations, earthquake, vehicle vibrations and installations mistakes, which cause the different loading conditions. One may also pointed out that axial stresses would be much more time-varying than basically pressure induced hoop stresses and hence would tend to facilitate the formation and propagation of fatigue cracks in the circumferential direction.

Due to the three-dimensional nature of the problem, the crack problem in shells appears to be, at least at the present time, analytically intractable. However, the through crack problem can be treated within the confines of various shell theories. In fracture problems related to shells, the classical shell theory has been used in most of the existing solutions. In the classical shell theory, the transverse shear effects are neglected and eighth order classical shell theory is used to formulate the problem. Due to this approximation, one can have only four boundary conditions on the shell boundary. Hence, the crack surface boundary conditions are approximated by using the Kirchhoff assumption (i.e. instead of satisfying the conditions  $M_{ns}$ ,  $V = 0$  separately, the condition  $V + \partial M_{ns} / \partial s = 0$  is satisfied where  $n, s$  are the coordinates normal and parallel to the crack surface,  $M_{ns}$  is the twisting moment and  $V$  is the transverse shear).

The first analysis of cracks in shells was presented by Folias in 1965 for a cracked sphere [1], [2] and for an axially cracked cylinder [3]. The circumferential cracked cylinder was investigated in 1967 [4]. The results in these papers are asymptotic in nature for short cracks. A shallow shell theory was also used which linearizes the governing equations.

In late 1960's Erdogan and Kibler [5] provided a more complete solution to the problems studied by Folias. In this study, shallow shell equations are employed, the numerical techniques for the solution of the singular integral equations are exact.

The major shortcoming of these early shell solutions, was the neglect of transverse shear deformation. In shells, since extension and bending are coupled, the elasticity concept of stress intensity factor cannot be used with these 8th order theories without redefinition. It was Sih and Hagendorf [6] in 1974 who first solved cracked shell problems by including the transverse shear effects. Later papers, which include the transverse shear effect use the shallow shell equations given by Naghdi [7], provided more exact and extensive results. For axially cracked cylinder, Krenk [8], and for the circumferentially cracked cylinder, Delale and Erdogan [9]. It was shown in these papers that the asymptotic stress field obtained is compatible with the solution obtained by the theory of elasticity; therefore standard fracture parameters such as stress intensity factors could be used. The skew-symmetric shell problem was studied by Delale [10] and it was shown that the mode II and III stress intensity

factors also have the same elasticity definition. Therefore, it appears that the simplest shell theory that may be used to study cracks in shells to obtain stress intensity factors, is the one that includes transverse shear deformation [11,12,7]. In 1983, Yahsi and Erdogan [13] solved the shallow shell problem for an arbitrarily oriented crack with respect to a principal line of curvature. They used Reissner's higher order shell theory which was used by Delale and Erdogan [9], but the analysis involved the in-plane and out-of-plane stress, moment and shear resultants because of the generality of the problem.

The problem of surface cracks in shells is inherently a three-dimensional elasticity problem that appears to be analytically intractable. There are, however, some numerical solutions based on the techniques of finite elements [14], [15] or boundary integral equations [16]. Rice [17], [18] introduced the so-called line-spring model which transformed the part through crack into a through crack by making use of the plane strain solution for an edge-cracked strip. This model has been shown to give very good results in spite of its simplicity. Therefore, within the limitations of this model, both through and part-through crack problems can be solved with the same plate or shell theory formulation. Delale and Erdogan [19] have used the same model, with a shallow shell formulation to predict stress intensity factors for surface cracks in cylinders. In the study of Joseph and Erdogan [20], the problem of shallow shell containing a surface crack and subjected to general loading conditions by using line-spring model is considered. They used the displacement quantities as unknowns, rather than their derivatives which were used in most of similar investigations.

The above mentioned solutions for part-through or through crack problems, which are based on either the classical shallow shell theory or a Reissner type transverse shear theory have all been given for infinite shells in the sense that the crack is assumed to be located sufficiently far from the boundaries and all other sources of stress disturbances so that all interaction effects may be neglected. The first analysis of fixed end problem was presented by Yahsi and Erdogan in 1985 for a pressurized cylindrical shell which contains an axial part-through or through crack [21].

The primary objective of this dissertation is to study the influence of a stiffened end on the stress intensity factors in a cylindrical shell containing a

circumferential through or a part-through crack under general loading conditions. Such problems may arise in pipes and cylindrical containers having flanges or end plates the stiffnesses of which are very high in comparison with those of the shell itself. Thus, in formulating the problem it may be assumed that the end of the shell is "fixed", that is all components of displacement and rotation vectors are zero. Then the problem is formulated for a specially orthotropic material by using Fourier integral transform technique. Similar to other crack problems, this mixed boundary value problem is reduced to a system of five simultaneous singular integral equations and they are solved numerically.

## CHAPTER II

### BASIC FORMULATION OF THE PROBLEM

In this problem the general shallow shell equations developed in [7] for an isotropic medium will be used. The equilibrium equations for a shallow shell may be expressed as,

$$N_{ij,j} = 0 \quad (2.1)$$

$$V_{i,j} + (Z_{,i} \cdot N_{ij})_{,j} + q(X_1, X_2) \quad (2.2)$$

$$M_{ij,j} - V_i = 0, \quad (i, j = 1, 2) \quad (2.3)$$

where  $X_1, X_2, X_3$  are the rectangular coordinates,  $X_1, X_2$  plane being tangent to the middle surface of the shell,  $Z = Z(X_1, X_2)$  is the equation of the middle surface,  $q$  is the surface loading, and  $N_{ij}, M_{ij}$  and  $V_i$  ( $i, j = 1, 2$ ) are respectively, membrane, moment and transverse shear resultants. The indicial notation and the summation convention are used in the formulation of the problem. The components of strains can be given by

$$\varepsilon_{ij} = \frac{1}{2} [U_{i,j} + U_{j,i} + Z_{,i} W_{,j} + Z_{,j} W_{,i}], \quad (i, j = 1, 2) \quad (2.4)$$

where  $U_1, U_2$  and  $W$  are the displacement components in  $X_1, X_2$  and  $Z$  directions. The normals of the shell in its original configuration change directions by the angles  $\beta_1$  and  $\beta_2$ . The slope of the middle surface changes by  $W_{,i}$ , and thus the effect of the transverse shear is expressed by

$$\theta_i = W_{,i} + \beta_i, \quad i = 1, 2 \quad (2.5)$$

If  $U_1$  and  $U_2$  are eliminated from equation (2.4), a compatibility equation can be obtained in the following form

$$e_{ik}e_{jl}(\epsilon_{ij,kl} + Z_{,ij}W_{kl}) = 0 \quad (2.6)$$

where  $e_{ik}$  is the permutation symbol (i.e.  $e_{11} = e_{22} = 0$  and  $e_{12} = -e_{21} = 1$ ) By using of the stress function  $F(X_1, X_2)$  defined by

$$N_{ij} = e_{ik}e_{jl}F_{,kl} \quad (2.7)$$

the equilibrium equation (2.1) is satisfied. If the generalized Hooke's law, which is expressed as

$$\epsilon_{ij} = a_{ijkl}N_{kl}/h \quad (2.8)$$

is used, the equations (2.2) and (2.6) reduce to

$$M_{ij,ij} + Z_{,ij}e_{ik}e_{jl}F_{,kl} + q = 0 \quad (2.9)$$

$$e_{im}e_{jn}e_{kp}e_{lq}a_{ijkl}F_{,mnpq} + hZ_{,ij}e_{ik}e_{jl}W_{,kl} = 0 \quad (2.10)$$

Even with simple geometries for anisotropic materials the differential equations are not tractable. However, as shown in [8] if one assumes a special orthotropy, the related differential operators in these equations can be factorized and the problem can be made analytically tractable. This factorization condition can be expressed as follows;

$$2G_{12} = (E_1E_2)^{1/2} / \left[ 1 + (v_1v_2)^{1/2} \right] \quad (2.11)$$

where  $E_1$ ,  $E_2$ ,  $v_1$ ,  $v_2$  and  $G_{12}$  are the material constants of the orthotropic material. The material which satisfies the condition (2.11) is called "specially orthotropic".

Defining

$$E = \sqrt{E_1 E_2}, \quad \nu = \sqrt{\nu_1 \nu_2}, \quad c = (E_1/E_2)^{1/2} \quad (2.12)$$

the relations between stress and displacement quantities in the shell may be expressed as

$$\begin{aligned} \epsilon_{11} &= \frac{1}{hE} \left( \frac{N_{11}}{c^2} - \nu N_{22} \right) \\ \epsilon_{12} &= \frac{1+\nu}{hE} N_{12} \\ \epsilon_{22} &= \frac{1}{hE} \left( c^2 N_{22} - \nu N_{11} \right) \end{aligned} \quad (2.13)$$

By using the assumption of linear variation of stress components  $\sigma_{ij}$  over the thickness, the moment resultants can be expressed by

$$\begin{aligned} M_{11} &= D \left( c^2 \beta_{1,1} + \nu \beta_{2,2} \right) \\ M_{12} &= \frac{D(1-\nu)}{2} \left( \beta_{1,2} + \beta_{2,1} \right) \\ M_{22} &= D \left( \nu \beta_{1,1} + \beta_{2,2}/c^2 \right) \end{aligned} \quad (2.14)$$

where  $D = Eh^3/12(1-\nu^2)$  and  $B$  is the effective shear modulus. Referring to [12], it will be assumed that

$$B = \frac{5}{6} \frac{E}{2(1+\nu)} \quad (2.15)$$

Defining now the operator

$$\nabla_c^2 = c \frac{\partial^2}{\partial X_1^2} + \frac{\partial^2}{c \partial X_2^2} \quad (2.16)$$

equations (2.9), (2.10) and (2.3) may be reduced to

$$\nabla_c^2 \nabla_c^2 F + hE \left( \frac{\partial^2 Z}{\partial X_1^2} \frac{\partial^2}{\partial X_2^2} - 2 \frac{\partial^2 Z}{\partial X_1 \partial X_2} \frac{\partial^2}{\partial X_1 \partial X_2} + \frac{\partial^2 Z}{\partial X_2^2} \frac{\partial^2}{\partial X_1^2} \right) W = 0 \quad (2.17)$$

$$D \nabla_c^2 \nabla_c^2 W - \left( 1 - \frac{D}{Bh} \nabla_c^2 \right) \left( \frac{\partial^2 Z}{\partial X_1^2} \frac{\partial^2}{\partial X_2^2} - 2 \frac{\partial^2 Z}{\partial X_1 \partial X_2} \frac{\partial^2}{\partial X_1 \partial X_2} + \frac{\partial^2 Z}{\partial X_2^2} \frac{\partial^2}{\partial X_1^2} \right) F = \left( 1 - \frac{D}{Bh} \nabla_c^2 \right) q \quad (2.18)$$

$$\beta_1 + \frac{\partial W}{\partial X_1} = \frac{D}{hB} \left[ \nabla_c^2 \beta_1 + \frac{(1+\nu)}{2c} \frac{\partial}{\partial X_2} \left( \frac{\partial \beta_2}{\partial X_1} - \frac{\partial \beta_1}{\partial X_2} \right) \right] \quad (2.19)$$

$$\beta_2 + \frac{\partial W}{\partial X_2} = \frac{D}{hB} \left[ \nabla_c^2 \beta_2 + c \frac{(1+\nu)}{2} \frac{\partial}{\partial X_1} \left( \frac{\partial \beta_1}{\partial X_2} - \frac{\partial \beta_2}{\partial X_1} \right) \right] \quad (2.20)$$

Equations (2.17)-(2.20) provide the formulation for an arbitrary shallow shell in terms of the unknown functions  $F$ ,  $W$ ,  $\beta_1$  and  $\beta_2$ .

Now let us assume that in the domain of interest the curvatures of the shell are constant. Then in (2.17) and (2.18) the terms involving  $Z$  may be replaced by

$$\begin{aligned} \frac{\partial^2 Z}{\partial X_1^2} &= -\frac{1}{R_1} \\ \frac{\partial^2 Z}{\partial X_2^2} &= -\frac{1}{R_2} \\ \frac{\partial^2 Z}{\partial X_1 \partial X_2} &= -\frac{1}{R_{12}} \end{aligned} \quad (2.21)$$

Also, following [13], if one introduces the dimensionless quantities given in Appendix A, equations (2.17)-(2.20) may further be simplified to

$$\nabla^4 \Phi - \frac{1}{\lambda^2} \left( \lambda_1^2 \frac{\partial^2}{\partial y^2} - 2\lambda_{12}^2 \frac{\partial^2}{\partial x \partial y} + \lambda_2^2 \frac{\partial^2}{\partial x^2} \right) \Phi = 0 \quad (2.22)$$

$$\nabla^4 w - \lambda^2 (1 - \kappa \nabla^2) \left( \lambda_1^2 \frac{\partial^2}{\partial y^2} - 2\lambda_{12}^2 \frac{\partial^2}{\partial x \partial y} + \lambda_2^2 \frac{\partial^2}{\partial x^2} \right) \Phi = \lambda^4 (1 - \kappa \nabla^2) \frac{a}{h} q \quad (2.23)$$

$$(1 - \kappa \nabla^2) \beta_x + \frac{\partial w}{\partial x} = \kappa \frac{1 + \nu}{2} \frac{\partial}{\partial y} \left( \frac{\partial \beta_y}{\partial x} - \frac{\partial \beta_x}{\partial y} \right) \quad (2.24)$$

$$(1 - \kappa \nabla^2) \beta_y + \frac{\partial w}{\partial y} = \kappa \frac{1 + \nu}{2} \frac{\partial}{\partial x} \left( \frac{\partial \beta_x}{\partial y} - \frac{\partial \beta_y}{\partial x} \right) \quad (2.25)$$

The constant  $a$  used in Appendix A to normalize various quantities is a characteristic length parameter in the shell. Usually in crack problems the shell is assumed to be "infinitely large" and  $a$  is taken to be half of the crack length.

Introducing new unknown functions  $\Omega$  and  $\Psi$  defined as follows

$$\Omega(x, y) = \frac{\partial \beta_x}{\partial y} - \frac{\partial \beta_y}{\partial x} \quad (2.26)$$

$$\Psi(x, y) = \kappa \left( \frac{\partial \beta_x}{\partial x} + \frac{\partial \beta_y}{\partial y} \right) - w \quad (2.27)$$

equations (2.24) and (2.25) may be expressed as follows

$$\beta_x = \kappa \nabla^2 \beta_x - \frac{\partial w}{\partial x} - \kappa \frac{1 + \nu}{2} \frac{\partial \Omega}{\partial y} \quad (2.28a)$$

$$\beta_y = \kappa \nabla^2 \beta_y - \frac{\partial w}{\partial y} + \kappa \frac{1 + \nu}{2} \frac{\partial \Omega}{\partial x} \quad (2.28b)$$

Then by using equations (2.26) and (2.27),  $\nabla^2\beta_x$  and  $\nabla^2\beta_y$  terms in (2.28a,b) can be written as follows

$$\nabla^2\beta_x = \frac{\partial\Omega}{\partial y} + \frac{\partial^2\beta_x}{\partial x^2} + \frac{\partial^2\beta_y}{\partial x\partial y} \quad (2.29a)$$

$$\nabla^2\beta_y = -\frac{\partial\Omega}{\partial x} + \frac{\partial^2\beta_y}{\partial y^2} + \frac{\partial^2\beta_x}{\partial x\partial y} \quad (2.29b)$$

Finally from equations (2.28a,b), and (2.29a,b), following relations can be obtained

$$\beta_x = \frac{\partial\Psi}{\partial x} - \kappa \frac{1-\nu}{2} \frac{\partial\Omega}{\partial y} \quad (2.30a)$$

$$\beta_y = \frac{\partial\Psi}{\partial y} - \kappa \frac{1-\nu}{2} \frac{\partial\Omega}{\partial x} \quad (2.30b)$$

In (2.30a,b), eliminating  $\Omega$  and then using (2.27) the following differential equation can be found

$$\kappa\nabla^2\Psi - \Psi - w = 0 \quad (2.31)$$

Similarly, by eliminating  $w$ , equations (2.28a,b) yield

$$\kappa \frac{1-\nu}{2} \nabla^2\Omega - \Omega = 0 \quad (2.32)$$

The solution of the shell problem must then satisfy the differential equations (2.22), (2.23), (2.31) and (2.32) and all the necessary boundary conditions.

## CHAPTER III

### A CYLINDRICAL SHELL WITH A FIXED END WHICH CONTAINS A CIRCUMFERENTIAL THROUGH CRACK

#### 3.1. Formulation of the Problem

Consider a specially orthotropic cylindrical shell with a fixed end which contains a circumferential through crack of length  $2a$  as shown in Figure 1. Let the shell be loaded with membrane forces, moments and transverse shear forces far away from the crack region, and let the surface loading  $q$  be zero.

To solve the problem, one may first consider a cylindrical shell without a crack which is fixed at  $X_1 = 0$  plane and which is subjected to the given set of external loads. Since the problem under consideration is linear, the solution of the cracked shell problem may then be obtained by adding to this uncracked shell results a perturbation solution obtained from the cracked shell with a fixed end by using equal and opposite stress, moment and shear force resultants from the first solution as the crack surface tractions.

For a cylindrical shell with a circumferential crack,  $\lambda_1 = 0 = \lambda_{12}$ , and equations (2.17), (2.18), (2.31) and (2.32) simplify to the following set of differential equations

$$\nabla^4 \Phi - \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{\partial^2 w}{\partial x^2} = 0 \quad (3.1.1)$$

$$\nabla^4 w + (\lambda \lambda_2)^2 \left( 1 - \kappa \nabla^2 \right) \frac{\partial^2 \Phi}{\partial x^2} = 0 \quad (3.1.2)$$

$$\kappa \nabla^2 \Psi - \Psi - w = 0 \quad (3.1.3)$$

$$\kappa \frac{1-\nu}{2} \nabla^2 \Omega - \Omega = 0 \quad (3.1.4)$$

Figure 1. Geometry of a Cylindrical Shell Containing Circumferential Through Crack with a Fixed End

By eliminating  $\Phi$  from equations (3.1.1) and (3.1.2), following equations can be obtained

$$\nabla^4 \nabla^4 w + \lambda_2^4 (1 - \kappa \nabla^2) \frac{\partial^4 w}{\partial x^4} = 0 \quad (3.1.5)$$

In the present study, the primary interest is in the problem of a cylindrical shell with a fixed end which contains a circumferential crack. So, for the shallow shell under consideration the solution of (3.1.5) may be expressed as

$$w(x, y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} f_1(x, \alpha) e^{-\alpha y} d\alpha + \frac{1}{2\pi} \int_{-\infty}^{+\infty} f_2(x, \beta) e^{-\beta y} d\beta \quad (3.1.6)$$

Assuming the solution of the ordinary differential equations resulting from (3.1.6) and (3.1.5) of the form

$$f_1(x, \alpha) = R(\alpha) e^{m x} \quad (3.1.7)$$

$$f_2(x, \beta) = S(\beta) e^{n(x+y)} \quad (3.1.8)$$

the characteristic equations giving  $m$  and  $n$  may be obtained as follows:

$$m^8 - (\kappa \lambda_2^4 + 4\alpha^2) m^6 + (6\alpha^4 + \lambda_2^4 + \alpha^2 \kappa \lambda_2^4) m^4 - 4\alpha^6 m^2 + \alpha^8 = 0 \quad (3.1.9)$$

$$n^8 - (\kappa \lambda_2^4 + 4\beta^2) n^6 + (6\beta^4 + \lambda_2^4 + \beta^2 \kappa \lambda_2^4) n^4 - 4\beta^6 n^2 + \beta^8 = 0 \quad (3.1.10)$$

It should be emphasized that the roots of (3.1.9) and (3.1.10) are in general complex, and, of course, are not known as a function of  $\alpha$  and  $\beta$  in closed form. Note that, ordered properly, the roots of (3.1.9) and (3.1.10) have the following property

$$\operatorname{Re}(m_j) < 0, \quad m_{j+4} = -m_j, \quad j=1,2,3,4 \quad (3.1.11)$$

$$\operatorname{Re}(n_j) < 0, \quad n_{j+4} = -n_j, \quad j=1,2,3,4 \quad (3.1.12)$$

then the solution of  $f_1(x, \alpha)$  and  $f_2(x, \beta)$ , which also satisfy the regularity condition at  $x = \pm\infty$  may be expressed as

$$f_1(x, \alpha) = \begin{cases} \sum_{j=1}^4 R_j(\alpha) e^{m_j x} & x > 0 \\ \sum_{j=5}^8 R_j(\alpha) e^{m_j x} & x < 0 \end{cases} \quad (3.1.13)$$

$$f_2(x, \beta) = \sum_{j=1}^4 S_j(\beta) e^{n_j(x+p_j)} \quad x > 0 \quad (3.1.14)$$

Similarly, by expressing the solution

$$\Phi(x, y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} g_1(x, \alpha) e^{-\alpha y} d\alpha + \frac{1}{2\pi} \int_{-\infty}^{+\infty} g_2(x, \beta) e^{-\beta y} d\beta \quad (3.1.15)$$

from (3.1.1) and (3.1.13), (3.1.14), the functions  $g_1$  and  $g_2$  may be obtained as

$$g_1(x, \alpha) = \begin{cases} \sum_{j=1}^4 R_j(\alpha) K_j e^{m_j x} & x > 0 \\ \sum_{j=5}^8 R_j(\alpha) K_j e^{m_j x} & x < 0 \end{cases} \quad (3.1.16)$$

$$g_2(x, \beta) = \sum_{j=1}^4 S_j(\beta) M_j e^{n_j(x+p_j)} \quad x > 0 \quad (3.1.17)$$

where

$$K_j = \left( \frac{m_j}{p_j} \right)^2 \left( \frac{\lambda_2}{\lambda} \right)^2 \quad (3.1.18)$$

$$M_j = \left( \frac{n_j}{s_j} \right)^2 \left( \frac{\lambda_2}{\lambda} \right)^2 \quad (3.1.19)$$

$$p_j = m_j^2 - \alpha^2 \quad (3.1.20)$$

$$s_j = n_j^2 - \beta^2 \quad (3.1.21)$$

Expressing now  $\Omega$  in the form

$$\Omega(x, y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} h_1(x, \alpha) e^{-\alpha y} d\alpha + \frac{1}{2\pi} \int_{-\infty}^{+\infty} h_2(x, \beta) e^{-\beta y} d\beta \quad (3.1.22)$$

and assuming that

$$\begin{aligned} h_1(x, \alpha) &= A(\alpha, r) e^{\alpha x} \\ h_2(x, \beta) &= B(\beta, t) e^{\beta x} \end{aligned} \quad (3.1.23)$$

from (3.1.24), it can be shown that the functions  $h_1$  and  $h_2$  satisfying the conditions at  $x = \pm\infty$  may be expressed as

$$h_1(x, \alpha) = \begin{cases} A_1 e^{\alpha x} & x > 0 \\ A_2 e^{\alpha x} & x < 0 \end{cases} \quad (3.1.24)$$

$$h_2(x, \beta) = B_1(\beta) e^{\beta(x+r)} \quad x > 0 \quad (3.1.25)$$

where

$$\begin{aligned} r_1 = -r_2 &= -\left[ \alpha^2 + \frac{2}{\kappa(1-\nu)} \right]^{\frac{1}{2}} \\ t_1 &= -\left[ \beta^2 + \frac{2}{\kappa(1-\nu)} \right]^{\frac{1}{2}} \end{aligned} \quad (3.1.26)$$

Finally, it may be shown that the remaining differential equation (3.1.3) will also be satisfied and the solution will have the proper behavior at  $x = \pm\infty$ , if it is assumed that

$$\Psi(x, y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} \theta_1(x, \alpha) e^{-\alpha y} d\alpha + \frac{1}{2\pi} \int_{-\infty}^{+\infty} \theta_2(x, \beta) e^{-\beta y} d\beta \quad (3.1.27)$$

$$\theta_1(x, \alpha) = \begin{cases} \sum_{j=1}^4 \frac{R_j(\alpha)}{\kappa p_j - 1} e^{m_j x} & x > 0 \\ \sum_{j=5}^8 \frac{R_j(\alpha)}{\kappa p_j - 1} e^{m_j x} & x < 0 \end{cases} \quad (3.1.28)$$

$$\theta_2(x, \beta) = \sum_{j=1}^4 \frac{S_j(\alpha)}{\kappa s_j - 1} e^{n_j(x+l)} \quad x > 0 \quad (3.1.29)$$

Thus, the problem is reduced to the determination of the unknown functions  $R_j(\alpha)$  ( $j=1, \dots, 8$ ),  $S_j(\beta)$  ( $j=1, \dots, 4$ ),  $A_j(\alpha)$  ( $j=1, 2$ ) and  $B_1(\beta)$  from the boundary conditions of the problem.

As mentioned earlier, the only external loads in the problem are the self-equilibrating force and moment resultants on the crack surfaces. Therefore, these fifteen unknowns are obtained by using the following continuity and boundary conditions:

$$\lim_{x \rightarrow 0^+} N_{xx} - \lim_{x \rightarrow 0^-} N_{xx} = 0 \quad -\infty < y < +\infty \quad (3.1.30)$$

$$\lim_{x \rightarrow 0^+} M_{xx} - \lim_{x \rightarrow 0^-} M_{xx} = 0 \quad -\infty < y < +\infty \quad (3.1.31)$$

$$\lim_{x \rightarrow 0^+} V_x - \lim_{x \rightarrow 0^-} V_x = 0 \quad -\infty < y < +\infty \quad (3.1.32)$$

$$\lim_{x \rightarrow 0^+} N_{xy} - \lim_{x \rightarrow 0^-} N_{xy} = 0 \quad -\infty < y < +\infty \quad (3.1.33)$$

$$\lim_{x \rightarrow 0^+} M_{xy} - \lim_{x \rightarrow 0^-} M_{xy} = 0 \quad -\infty < y < +\infty \quad (3.1.34)$$

$$\lim_{x \rightarrow -l} u = 0 \quad -\infty < y < +\infty \quad (3.1.35)$$

$$\lim_{x \rightarrow -l} \beta_x = 0 \quad -\infty < y < +\infty \quad (3.1.36)$$

$$\lim_{x \rightarrow -l^+} w = 0 \quad -\infty < y < +\infty \quad (3.1.37)$$

$$\lim_{x \rightarrow -l^+} v = 0 \quad -\infty < y < +\infty \quad (3.1.38)$$

$$\lim_{x \rightarrow -l^+} \beta_y = 0 \quad -\infty < y < +\infty \quad (3.1.39)$$

$$\begin{aligned} \lim_{x \rightarrow 0^+} N_{xx} + \lim_{x \rightarrow 0^-} N_{xx} &= 2F_{10}(y) & |y| < \sqrt{c} \\ \lim_{x \rightarrow 0^+} u - \lim_{x \rightarrow 0^-} u &= 0 & |y| > \sqrt{c} \end{aligned} \quad (3.1.40a,b)$$

$$\begin{aligned} \lim_{x \rightarrow 0^+} M_{xx} + \lim_{x \rightarrow 0^-} M_{xx} &= 2F_{20}(y) & |y| < \sqrt{c} \\ \lim_{x \rightarrow 0^+} \beta_x - \lim_{x \rightarrow 0^-} \beta_x &= 0 & |y| > \sqrt{c} \end{aligned} \quad (3.1.41a,b)$$

$$\begin{aligned} \lim_{x \rightarrow 0^+} V_x + \lim_{x \rightarrow 0^-} V_x &= 2F_{30}(y) & |y| < \sqrt{c} \\ \lim_{x \rightarrow 0^+} w - \lim_{x \rightarrow 0^-} w &= 0 & |y| > \sqrt{c} \end{aligned} \quad (3.1.42a,b)$$

where  $F_{j0}$  ( $j=1,\dots,5$ ) are known crack surface loads.

Using (3.1.6), and (3.1.13)-(3.1.29), from the basic expressions given in Chapter 2, the components of the stress and moment resultants and, the displacements and rotations may be obtained as:

$$N_{xx}(x,y) = \begin{cases} -\frac{1}{2\pi} \int_{-\infty}^{+\infty} \alpha^2 \sum_{j=1}^4 K_j R_j(\alpha) e^{m_j x} e^{-\kappa y} d\alpha - \\ \frac{1}{2\pi} \int_{-\infty}^{+\infty} \beta^2 \sum_{j=1}^4 M_j S_j(\beta) e^{n_j(x+l)} e^{-\beta y} d\beta, & x > 0 \\ -\frac{1}{2\pi} \int_{-\infty}^{+\infty} \alpha^2 \sum_{j=5}^8 K_j R_j(\alpha) e^{m_j x} e^{-\kappa y} d\alpha - \\ \frac{1}{2\pi} \int_{-\infty}^{+\infty} \beta^2 \sum_{j=1}^4 M_j S_j(\beta) e^{n_j(x+l)} e^{-\beta y} d\beta, & x < 0 \end{cases} \quad (3.1.45)$$

$$M_{xx}(x,y) = \begin{cases} \frac{1}{2\pi h\lambda^4} \int_{-\infty}^{+\infty} \sum_{j=1}^4 \frac{(1-\nu)\alpha^2 + p_j}{\kappa p_j - 1} R_j(\alpha) e^{m_j x} e^{-\kappa y} d\alpha - \\ \frac{1}{2\pi h\lambda^4} \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} iA_1(\alpha) \alpha r_1 e^{r_1 x} e^{-\kappa y} d\alpha + \\ \frac{1}{2\pi h\lambda^4} \int_{-\infty}^{+\infty} \sum_{j=1}^4 \frac{(1-\nu)\beta^2 + s_j}{\kappa s_j - 1} S_j(\beta) e^{n_j(x+l)} e^{-\beta y} d\beta - \\ \frac{1}{2\pi h\lambda^4} \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} iB_1(\beta) \beta t_1 e^{t_1(x+l)} e^{-\beta y} d\beta, & x > 0 \\ \frac{1}{2\pi h\lambda^4} \int_{-\infty}^{+\infty} \sum_{j=5}^8 \frac{(1-\nu)\alpha^2 + p_j}{\kappa p_j - 1} R_j(\alpha) e^{m_j x} e^{-\kappa y} d\alpha - \\ \frac{1}{2\pi h\lambda^4} \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} iA_2(\alpha) \alpha r_2 e^{r_2 x} e^{-\kappa y} d\alpha + \\ \frac{1}{2\pi h\lambda^4} \int_{-\infty}^{+\infty} \sum_{j=1}^4 \frac{(1-\nu)\beta^2 + s_j}{\kappa s_j - 1} S_j(\beta) e^{n_j(x+l)} e^{-\beta y} d\beta - \\ \frac{1}{2\pi h\lambda^4} \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} iB_1(\beta) \beta t_1 e^{t_1(x+l)} e^{-\beta y} d\beta, & x < 0 \end{cases} \quad (3.1.46)$$

$$\begin{aligned}

From (3.1.40)-(3.1.44), it is seen that mixed boundary conditions are given in terms of complementary stress and displacement quantities and the displacement quantities would be the natural new unknown functions in the system of integral equations to be derived. However, in order to avoid kernels with strong singularities in the resulting integral equations, it is necessary that the new unknown functions be selected as the derivatives of the displacement quantities rather than displacements and rotations themselves. In the present problem, the derivation of the integral equations and the asymptotic analysis become relatively simple if the complementary displacement quantities (which are the new unknowns) are selected as follows:

$$G_1(y) = \lim_{x \rightarrow 0^+} \frac{\partial u}{\partial y} - \lim_{x \rightarrow 0^-} \frac{\partial u}{\partial y}, \quad -\infty < y < +\infty \quad (3.1.58)$$

$$G_2(y) = \lim_{x \rightarrow 0^+} \frac{\partial \beta_x}{\partial y} - \lim_{x \rightarrow 0^-} \frac{\partial \beta_x}{\partial y}, \quad -\infty < y < +\infty \quad (3.1.59)$$

$$G_3(y) = \lim_{x \rightarrow 0^+} \frac{\partial w}{\partial y} - \lim_{x \rightarrow 0^-} \frac{\partial w}{\partial y}, \quad -\infty < y < +\infty \quad (3.1.60)$$

$$G_4(y) = \lim_{x \rightarrow 0^+} \left[ \frac{\partial u}{\partial y} - \left( \frac{\lambda_2}{\lambda} \right)^2 y \frac{\partial w}{\partial y} \right] - \lim_{x \rightarrow 0^-} \left[ \frac{\partial u}{\partial y} - \left( \frac{\lambda_2}{\lambda} \right)^2 y \frac{\partial w}{\partial y} \right], \quad -\infty < y < +\infty \quad (3.1.61)$$

$$G_5(y) = \lim_{x \rightarrow 0^+} \frac{\partial \beta_y}{\partial y} - \lim_{x \rightarrow 0^-} \frac{\partial \beta_y}{\partial y}, \quad -\infty < y < +\infty \quad (3.1.62)$$

By using the dimensionless quantities given in Appendix A, the functions  $G_j$  ( $j=1, \dots, 5$ ) may be expressed in terms of the unknown functions  $R_j$  ( $j=1, \dots, 8$ ) and  $A_j$  ( $j=1, 2$ ) as follows [13]:

$$G_1(y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} \frac{i}{\alpha} \left[ \sum_{j=1}^4 \left( \frac{\lambda_2^2}{\lambda^2} - K_j p_j \right) m_j R_j(\alpha) - \sum_{j=5}^8 \left( \frac{\lambda_2^2}{\lambda^2} - K_j p_j \right) m_j R_j(\alpha) \right] e^{-\alpha y} d\alpha, \quad (3.1.63)$$

$$G_2(y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} -i\alpha \left[ \sum_{j=1}^4 \frac{R_j(\alpha) m_j}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{R_j(\alpha) m_j}{\kappa p_j - 1} \right] e^{-\alpha y} d\alpha - \frac{1}{2\pi} \int_{-\infty}^{+\infty} \frac{\alpha^2 \kappa (1 - \nu)}{2} [A_1(\alpha) - A_2(\alpha)] e^{-\alpha y} d\alpha, \quad (3.1.64)$$

$$G_3(y) = -\frac{1}{2\pi} \int_{-\infty}^{+\infty} i\alpha \left[ \sum_{j=1}^4 R_j(\alpha) - \sum_{j=5}^8 R_j(\alpha) \right] e^{-\alpha y} d\alpha, \quad (3.1.65)$$

$$G_4(y) = \frac{1}{2\pi} \int_{-\infty}^{+\infty} \left\{ \sum_{j=1}^4 R_j(\alpha) K_j [p_j + (1 + \nu)\alpha^2] - \sum_{j=5}^8 R_j(\alpha) K_j [p_j + (1 + \nu)\alpha^2] \right\} e^{-\alpha y} d\alpha, \quad (3.1.66)$$

$$G_5(y) = -\frac{1}{2\pi} \int_{-\infty}^{+\infty} \alpha^2 \left[ \sum_{j=1}^4 \frac{R_j(\alpha)}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{R_j(\alpha)}{\kappa p_j - 1} \right] e^{-\alpha y} d\alpha + \frac{1}{2\pi} \int_{-\infty}^{+\infty} \frac{\kappa(1-\nu)}{2} i\alpha \left[ r_1 A_1(\alpha) - r_2 A_2(\alpha) \right] e^{-\alpha y} d\alpha \quad (3.1.67)$$

Substituting from (3.1.45)-(3.1.49) into (3.1.30)-(3.1.34) and (3.1.53)-(3.1.57) into (3.1.35)-(3.1.39) and inverting the results, the homogeneous boundary conditions (3.1.30)-(3.1.39) become

$$\sum_{j=1}^4 K_j R_j(\alpha) - \sum_{j=5}^8 K_j R_j(\alpha) = 0 \quad (3.1.68)$$

$$\sum_{j=1}^4 \frac{[p_j + (1+\nu)\alpha^2]}{\kappa p_j - 1} R_j(\alpha) - \sum_{j=5}^8 \frac{[p_j + (1+\nu)\alpha^2]}{\kappa p_j - 1} R_j(\alpha) - \frac{\kappa(1-\nu)^2 i\alpha}{2} [r_1 A_1(\alpha) - r_2 A_2(\alpha)] = 0 \quad (3.1.69)$$

$$\sum_{j=1}^4 \frac{p_j m_j}{\kappa p_j - 1} R_j(\alpha) - \sum_{j=5}^8 \frac{p_j m_j}{\kappa p_j - 1} R_j(\alpha) - \frac{(1-\nu)i\alpha}{2} [A_1(\alpha) - A_2(\alpha)] = 0 \quad (3.1.70)$$

$$\sum_{j=1}^4 K_j m_j R_j(\alpha) - \sum_{j=5}^8 K_j m_j R_j(\alpha) = 0 \quad (3.1.71)$$

$$i\alpha \sum_{j=1}^4 \frac{m_j R_j(\alpha)}{\kappa p_j - 1} - i\alpha \sum_{j=5}^8 \frac{m_j R_j(\alpha)}{\kappa p_j - 1} + \frac{\kappa(1-\nu)i\alpha}{4} (\alpha^2 + r_1^2) [A_1(\alpha) - A_2(\alpha)] = 0 \quad (3.1.72)$$

$$\sum_{j=5}^8 \left[ (2+\nu)K_j m_j - K_j \frac{m_j^3}{\alpha^2} + \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{m_j}{\alpha^2} \right] R_j e^{-m_j y'} + \sum_{j=1}^4 \left[ (2+\nu)M_j n_j - M_j \frac{n_j^3}{\beta^2} + \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{n_j}{\beta^2} \right] S_j = 0 \quad (3.1.73)$$

$$\sum_{j=5}^8 \frac{R_j m_j}{\kappa p_j - 1} e^{m_j t} - \frac{\kappa(1-\nu)}{2} A_2(\alpha) \beta t + \sum_{j=1}^4 \frac{S_j n_j}{\kappa s_j - 1} - \frac{\kappa(1-\nu)}{2} B_1(\beta) \beta t = 0 \quad (3.1.74)$$

$$\sum_{j=5}^8 R_j e^{m_j t} + \sum_{j=1}^4 S_j = 0 \quad (3.1.75)$$

$$\sum_{j=5}^8 \left[ \frac{K_j m_j}{\alpha} + \nu \alpha K_j - \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{1}{\alpha} \right] R_j e^{m_j t} + \sum_{j=1}^4 \left[ \frac{M_j n_j}{\beta} - \nu \beta M_j + \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{1}{\beta} \right] S_j = 0 \quad (3.1.76)$$

$$i\alpha \sum_{j=5}^8 \frac{R_j}{\kappa p_j - 1} e^{m_j t} + \frac{\kappa(1-\nu)}{2} A_2(\alpha) t_2 e^{t_2 t} + \beta \sum_{j=1}^4 \frac{S_j}{\kappa s_j - 1} + \frac{\kappa(1-\nu)}{2} B_2(\beta) t_1 = 0 \quad (3.1.77)$$

Also, inverting the Fourier integrals (3.1.63)-(3.1.67) and observing that  $G_i = 0$  ( $i=1, \dots, 5$ ) for  $-\infty < y < -\sqrt{c}$ ,  $\sqrt{c} < y < \infty$ , following expressions may be obtained

$$q_1(\alpha) = \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{q_2(\alpha)}{\alpha^2} - \frac{i}{\alpha} \left[ \sum_{j=1}^4 K_j p_j m_j R_j(\alpha) - \sum_{j=5}^8 K_j p_j m_j R_j(\alpha) \right] \quad (3.1.78)$$

$$q_2(\alpha) = \frac{A_1(\alpha) - A_1(\alpha)}{2} = i\alpha \left[ \sum_{j=1}^4 m_j R_j(\alpha) - \sum_{j=5}^8 m_j R_j(\alpha) \right] \quad (3.1.79)$$

$$q_3(\alpha) = -i\alpha \left[ \sum_{j=1}^4 R_j(\alpha) - \sum_{j=5}^8 R_j(\alpha) \right] \quad (3.1.80)$$

$$q_4(\alpha) = \sum_{j=1}^4 p_j K_j R_j(\alpha) - \sum_{j=5}^8 p_j K_j R_j(\alpha) \quad (3.1.81)$$

$$q_5(\alpha) = \frac{1}{(1-\nu)} \left[ \sum_{j=1}^4 \frac{p_j R_j(\alpha)}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{p_j R_j(\alpha)}{\kappa p_j - 1} \right] \quad (3.1.82)$$

where

$$q_1(\alpha) = \int_{-\sqrt{c}}^{+\sqrt{c}} G_1(t) e^{-\alpha t} dt \quad (3.1.83)$$

$$q_2(\alpha) = \int_{-\sqrt{c}}^{+\sqrt{c}} G_2(t) e^{-\alpha t} dt \quad (3.1.84)$$

$$q_3(\alpha) = \int_{-\sqrt{c}}^{+\sqrt{c}} G_3(t) e^{-\alpha t} dt \quad (3.1.85)$$

$$q_4(\alpha) = \int_{-\sqrt{c}}^{+\sqrt{c}} G_4(t) e^{-\alpha t} dt \quad (3.1.86)$$

$$q_5(\alpha) = \int_{-\sqrt{c}}^{+\sqrt{c}} G_5(t) e^{-\alpha t} dt \quad (3.1.87)$$

The algebraic equations (3.1.68)-(3.1.77) can now be solved to give  $R_j$  ( $j=1, \dots, 8$ ),  $S_j$  ( $j=1, \dots, 4$ ),  $A_j$  ( $j=1, 2$ ) and  $B_1$  in terms of  $q_1, \dots, q_5$  as follows:

$$R_j(\alpha) = \left[ Q_j(\alpha) q_1(\alpha) + N_j(\alpha) q_2(\alpha) + C_j(\alpha) q_3(\alpha) + D_j(\alpha) q_4(\alpha) + Y_j(\alpha) q_5(\alpha) \right], \quad j=1, 2, \dots, 8 \quad (3.1.88)$$

$$S_j(\beta) = \left[ Q'_j(\beta) q_1(\beta) + N'_j(\beta) q_2(\beta) + C'_j(\beta) q_3(\beta) + D'_j(\beta) q_4(\beta) + Y'_j(\beta) q_5(\beta) \right], \quad j=1, 2, 3, 4 \quad (3.1.89)$$

$$A_1(\alpha) = U_1(\alpha) q_1(\alpha) + U_2(\alpha) q_2(\alpha) + U_3(\alpha) q_3(\alpha) + U_4(\alpha) q_4(\alpha) + U_5(\alpha) q_5(\alpha) \quad (3.1.90)$$

$$B_1(\beta) = U_1(\beta)q_1(\beta) + U_2(\beta)q_2(\beta) + U_3(\beta)q_3(\beta) + U_4(\beta)q_4(\beta) + U_5(\beta)q_5(\beta) \quad (3.1.91)$$

$$A_2(\alpha) = V_1(\alpha)q_1(\alpha) + V_2(\alpha)q_2(\alpha) + V_3(\alpha)q_3(\alpha) + V_4(\alpha)q_4(\alpha) + V_5(\alpha)q_5(\alpha) \quad (3.1.92)$$

where  $Q_j(\alpha)$ ,  $N_j(\alpha)$ ,  $C_j(\alpha)$ ,  $D_j(\alpha)$ ,  $Y_j(\alpha)$  ( $j=1,\dots,8$ ),  $Q_j^*(\beta)$ ,  $N_j^*(\beta)$ ,  $C_j^*(\beta)$ ,  $D_j^*(\beta)$ ,  $Y_j^*(\beta)$  ( $j=1,\dots,4$ ),  $U_i(\alpha)$  ( $i=1,\dots,5$ ),  $U_i^*(\beta)$  ( $i=1,\dots,5$ ) and  $V_i(\beta)$  ( $i=1,\dots,5$ ) are known functions and are given implicitly by the system of equations (3.1.63)-(3.1.77). Then all the unknowns of the problem are expressed in terms of  $G_1,\dots,G_5$ .

It can be seen that the equations (3.1.40a), (3.1.41a), (3.1.42a), (3.1.43a), (3.1.44a) related to the crack surface loading would then give the integral equations to determine  $G_1,\dots,G_5$ . By substituting (3.1.45)-(3.1.49) into (3.1.40a)-(3.1.44a) following integral equations can be obtained:

$$\begin{aligned} & \lim_{x \rightarrow 0^+} \left\{ -\frac{1}{2\pi} \int_{-\infty}^{+\infty} \alpha^2 \sum_{j=1}^4 K_j R_j(\alpha) e^{m_j x} e^{-\alpha y} d\alpha - \right. \\ & \quad \left. \frac{1}{2\pi} \int_{-\infty}^{+\infty} \beta^2 \sum_{j=1}^4 M_j S_j(\beta) e^{n_j(x+l)} e^{-\beta y} d\beta \right\} + \\ & \lim_{x \rightarrow 0^-} \left\{ -\frac{1}{2\pi} \int_{-\infty}^{+\infty} \alpha^2 \sum_{j=5}^8 K_j R_j(\alpha) e^{m_j x} e^{-\alpha y} d\alpha - \right. \\ & \quad \left. \frac{1}{2\pi} \int_{-\infty}^{+\infty} \beta^2 \sum_{j=1}^4 M_j S_j(\beta) e^{n_j(x+l)} e^{-\beta y} d\beta \right\} = 2F_{10}(y), \quad -\sqrt{c} < y < \sqrt{c} \end{aligned} \quad (3.1.93)$$

$$\begin{aligned}
& \lim_{x \rightarrow 0^+} \frac{1}{2\pi} \frac{a}{h\lambda^4} \left\{ \int_{-\infty}^{+\infty} \sum_{j=1}^4 \frac{p_j + (1-\nu)\alpha^2}{\kappa p_j - 1} R_j(\alpha) e^{m,x} e^{-\kappa y} d\alpha - \right. \\
& \quad \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} A_1(\alpha) \alpha t_1 e^{i x} e^{-\kappa y} d\alpha + \\
& \quad \int_{-\infty}^{+\infty} \sum_{j=1}^4 \frac{s_j + (1-\nu)\beta^2}{\kappa s_j - 1} S_j(\beta) e^{n,(x+l)} e^{-\beta y} d\beta - \\
& \quad \left. \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} B_1(\beta) \beta t_1 e^{i(x+l)} e^{-\beta y} d\beta \right\} + \\
& \lim_{x \rightarrow 0^-} \frac{1}{2\pi} \frac{a}{h\lambda^4} \left\{ \int_{-\infty}^{+\infty} \sum_{j=5}^8 \frac{p_j + (1-\nu)\alpha^2}{\kappa p_j - 1} R_j(\alpha) e^{m,x} e^{-\kappa y} d\alpha - \right. \\
& \quad \frac{\kappa(1-\nu)^2}{2} \int_{-\infty}^{+\infty} A_2(\alpha) \alpha t_2 e^{i 2x} e^{-\kappa y} d\alpha + \\

& \quad \left. \int_{-\infty}^{+\infty} \sum_{j=1}^4 \frac{\kappa s_j n_j S_j(\beta)}{\kappa s_j - 1} e^{n,(x+l)} e^{-\beta y} d\beta - \frac{\kappa(1-\nu)}{2} \int_{-\infty}^{+\infty} B_1(\beta) \beta e^{i(x+l)} e^{-\beta y} d\beta \right\} \\
& \hspace{15em} = 2F_{30}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (3.1.95)
\end{aligned}$$

$$\begin{aligned}
& \lim_{x \rightarrow 0^+} \frac{i}{2\pi} \left\{ \int_{-\infty}^{+\infty} \alpha \sum_{j=1}^4 K_{j,m} R_j(\alpha) e^{m,x} e^{-\kappa y} d\alpha + \int_{-\infty}^{+\infty} \beta \sum_{j=1}^4 M_{j,n} S_j(\beta) e^{n,(x+l)} e^{-\beta y} d\beta + \right. \\
& \lim_{x \rightarrow 0^-} \frac{i}{2\pi} \left\{ \int_{-\infty}^{+\infty} \alpha \sum_{j=5}^8 K_{j,m} R_j(\alpha) e^{m,x} e^{-\kappa y} d\alpha + \int_{-\infty}^{+\infty} \beta \sum_{j=1}^4 M_{j,n} S_j(\beta) e^{n,(x+l)} e^{-\beta y} d\beta \right. \\
& \hspace{15em} = 2F_{40}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (3.1.96)
\end{aligned}$$

$$\begin{aligned}
& - \lim_{x \rightarrow 0^+} \frac{1}{2\pi} \frac{d(1-\nu)}{h\lambda^4} \left\{ \int_{-\infty}^{+\infty} i\alpha \sum_{j=1}^4 \frac{m_j R_j(\alpha)}{\kappa p_j - 1} e^{m_j x} e^{-\alpha y} d\alpha - \right. \\
& \frac{\kappa(1-\nu)}{4} \int_{-\infty}^{+\infty} (\alpha^2 + r_1^2) A_1(\alpha) e^{r_1 x} e^{-\alpha y} d\alpha + \int_{-\infty}^{+\infty} \beta \sum_{j=1}^4 \frac{n_j S_j(\beta)}{\kappa s_j - 1} e^{n_j(x+l)} e^{-\beta y} d\beta + \\
& \left. \frac{\kappa(1-\nu)}{4} \int_{-\infty}^{+\infty} (\beta^2 + r_1^2) B_1(\beta) e^{r_1(x+l)} e^{-\beta y} d\beta \right\} - \\
& \lim_{x \rightarrow 0^-} \frac{1}{2\pi} \frac{d(1-\nu)}{h\lambda^4} \left\{ \int_{-\infty}^{+\infty} i\alpha \sum_{j=5}^8 \frac{m_j R_j(\alpha)}{\kappa p_j - 1} e^{m_j x} e^{-\alpha y} d\alpha + \right. \\
& \frac{\kappa(1-\nu)}{4} \int_{-\infty}^{+\infty} (\alpha^2 + r_2^2) A_2(\alpha) e^{r_2 x} e^{-\alpha y} d\alpha + \int_{-\infty}^{+\infty} \beta \sum_{j=1}^4 \frac{n_j S_j(\beta)}{\kappa s_j - 1} e^{n_j(x+l)} e^{-\beta y} d\beta + \\
& \left. \frac{\kappa(1-\nu)}{4} \int_{-\infty}^{+\infty} (\beta^2 + r_1^2) B_1(\beta) e^{r_1(x+l)} e^{-\beta y} d\beta \right\} = 2F_{50}(y), \quad -\sqrt{c} < y < \sqrt{c}
\end{aligned} \tag{3.1.97}$$

By using equations (3.1.83)-(3.1.87) and (3.1.88)-(3.1.92) and observing that  $G_j(y) = 0$  for  $|y| > \sqrt{c}$  ( $j=1, \dots, 5$ ), equations (3.1.93)-(3.1.97) can be written as

$$\begin{aligned}
& \lim_{x \rightarrow 0^+} \int_{-\sqrt{c}}^{+\sqrt{c}} \sum_{j=1}^5 G_j(t) dt \left\{ \int_{-\infty}^{+\infty} O_{k_j}(\alpha, x) e^{-i(t-y)\alpha} d\alpha + \int_{-\infty}^{+\infty} Z_{k_j}(\beta, x) e^{-i(t-y)\beta} d\beta \right\} + \\
& \lim_{x \rightarrow 0^-} \int_{-\sqrt{c}}^{+\sqrt{c}} \sum_{j=1}^5 G_j(t) dt \left\{ \int_{-\infty}^{+\infty} O_{k_j}^*(\alpha, x) e^{-i(t-y)\alpha} d\alpha + \int_{-\infty}^{+\infty} Z_{k_j}^*(\beta, x) e^{-i(t-y)\beta} d\beta \right\} \\
& = 2F_k(y), \quad k=1, 2, \dots, 5
\end{aligned} \tag{3.1.98}$$

where  $O_{k_j}$ ,  $O_{k_j}^*$ ,  $Z_{k_j}$ , and  $Z_{k_j}^*$  are complicated but known functions and contain exponential damping terms of the form  $e^{m_j x}$  ( $j=1, \dots, 8$ ),  $e^{n_j(x+l)}$  ( $j=1, \dots, 4$ ),  $e^{r_j x}$  ( $j=1, 2$ ) and  $e^{r_1(x+l)}$ . However, in the limiting case of  $x \rightarrow 0$  for  $y=t$  and also the case of  $(x, l') \rightarrow 0$  for  $(y, t) \rightarrow 0$ , this damping does not insure the convergence of the inner integrals if the functions  $O_{k_j}$ ,  $O_{k_j}^*$ ,  $Z_{k_j}$ , and  $Z_{k_j}^*$  do not decay sufficiently fast as  $|\alpha, \beta| \rightarrow \infty$  in equation (3.1.98). For this particular problem, the case of  $(x, l') \rightarrow 0$  for  $(y, t) \rightarrow 0$ , (i.e. circumferential crack touches the fixed end), is not taken into consideration. To extract the singularities for the case of  $x \rightarrow 0$  for  $y=t$ , (i.e. circumferential crack does not touch the fixed end), asymptotic behavior of the inner integrals has to be examined. This can be done in closed form by first extracting the

asymptotic values of  $m_j(\alpha)$ ,  $n_j(\beta)$ ,  $r_j(\alpha)$  and  $t_1(\beta)$  from the characteristic equations (3.1.9), (3.1.10) and (3.1.26) and then by substituting these values into the expressions of  $O_{kj}$ ,  $O_{kj}^*$ ,  $Z_{kj}$ , and  $Z_{kj}^*$ . From the characteristic equations it can be shown that for large values of  $|\alpha|$  and  $\beta$ , we have,

$$m_j(\alpha) = -|\alpha| \left( 1 + \frac{p_j}{2\alpha^2} - \frac{p_j^2}{8\alpha^4} + \dots \right), \quad (j=1, \dots, 4) \quad (3.1.99)$$

$$m_j(\alpha) = |\alpha| \left( 1 + \frac{p_j}{2\alpha^2} - \frac{p_j^2}{8\alpha^4} + \dots \right), \quad (j=5, \dots, 8) \quad (3.1.100)$$

$$n_j(\beta) = -\beta \left( 1 + \frac{s_j}{2\beta^2} - \frac{s_j^2}{8\beta^4} + \dots \right), \quad (j=1, \dots, 4) \quad (3.1.101)$$

$$r_1(\alpha) = -|\alpha| \left( 1 + \frac{1}{\kappa(1-\nu)\alpha^2} - \dots \right), \quad (3.1.102)$$

$$r_2(\alpha) = |\alpha| \left( 1 + \frac{1}{\kappa(1-\nu)\alpha^2} - \dots \right), \quad (3.1.103)$$

$$t_1(\beta) = -\beta \left( 1 + \frac{1}{\kappa(1-\nu)\beta^2} - \dots \right), \quad (3.1.104)$$

The asymptotic values of  $O_{kj}$ ,  $O_{kj}^*$ ,  $Z_{kj}$ , and  $Z_{kj}^*$  for large values of  $|\alpha|$  and  $\beta$ , may then be obtained by using (3.1.99)-(3.1.104). It should be noticed that as  $x \rightarrow 0$ , the second inner integrals in (3.1.98) are convergent because of the exponential damping term  $e^{-\beta t}$ . By adding and subtracting the asymptotic values  $O_{kj}$ , and  $Z_{kj}$ , for large values of  $|\alpha|$ , the singular parts of the kernels can be separated. As an example, consider the equation (3.1.96). It can be rewritten as follows:

$$\lim_{x \rightarrow 0^+} \frac{i}{2\pi} \int_{-\infty}^{+\infty} \alpha \left( \sum_{j=1}^4 K_j m_j R_j(\alpha) e^{m_j x} + \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-m_j x} \right) e^{-tx} d\alpha +$$

$$\lim_{x \rightarrow 0^+} \frac{i}{\pi} \int_{-\infty}^{+\infty} \beta \sum_{j=1}^4 M_j n_j S_j(\beta) e^{n_j(x+t)} e^{-\beta y} d\beta = 2F_{40}(y) \quad (3.1.105)$$

If one notices the equation (3.1.73), it is clear that

$$\sum_{j=1}^4 M_j n_j S_j(\beta) = - \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-m_j t} \quad (3.1.106)$$

Substituting (3.1.106) into (3.1.105) and using the asymptotic expansion of  $m_j$  given in (3.1.99) and (3.1.100), and separating the leading terms in the right hand side of equation, (3.1.105) can be expressed as

$$T_1 = \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \frac{i\alpha}{2\pi} \sum_{j=1}^4 K_j m_j R_j(\alpha) e^{-|\alpha|x} e^{-tx} d\alpha +$$

$$\lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \frac{i\alpha}{2\pi} \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-|\alpha|(x+2t)} e^{-tx} d\alpha \quad (3.1.107)$$

It should be noticed that as  $x \rightarrow 0$ , the second integral in (3.1.107) is convergent because of the exponential damping term  $e^{-2\alpha t}$ . So it is seen that to separate the singular part of (3.1.107), the asymptotic value of  $\sum_1^8 K_j m_j R_j$  as  $|\alpha| \rightarrow \infty$  should be known. By using (3.1.99) and (3.1.100),  $\sum_1^8 K_j m_j R_j$  can be expressed as

$$\sum_{j=1}^8 K_j m_j R_j(\alpha) = -\alpha \operatorname{sign}(\alpha) \left\{ \left[ \sum_{j=1}^4 K_j R_j(\alpha) - \sum_{j=5}^8 K_j R_j(\alpha) \right] + \right.$$

$$\left. + \frac{1}{2\alpha^2} \left[ \sum_{j=1}^4 K_j p_j R_j(\alpha) - \sum_{j=5}^8 K_j p_j R_j(\alpha) \right] - \dots \dots \dots \right\} \quad (3.1.108)$$

From (3.1.68), we know that  $\sum_1^4 K_j R_j - \sum_5^8 K_j R_j = 0$ , so equation (3.1.108) can be rewritten as

$$\sum_{j=1}^8 K_j m_j R_j(\alpha) = -\frac{\text{sign}(\alpha)}{2\alpha} \left\{ \left[ \sum_{j=1}^4 K_j p_j R_j(\alpha) - \sum_{j=5}^8 K_j p_j R_j(\alpha) \right] - \dots \right\} \quad (3.1.109)$$

Also by using (3.1.81) and neglecting the lower order terms, equation (3.1.109) can be expressed as follows:

$$\sum_1^8 K_j m_j R_j(\alpha) = -\frac{\text{sign}(\alpha)}{2\alpha} q_4 \quad (3.1.110)$$

Then, equation (3.1.107), can be rewritten as

$$\begin{aligned} & \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \left[ i\alpha \left( \sum_{j=1}^4 K_j m_j R_j(\alpha) e^{m_j x} + \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-m_j x} \right) + \right. \\ & \quad \left. \frac{i}{2} \text{sign}(\alpha) q_4(\alpha) e^{-|\alpha|x} \right] e^{-tx} dx - \\ & \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \frac{i}{2} \text{sign}(\alpha) q_4(\alpha) e^{-|\alpha|x} e^{-tx} dx - \\ & \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} 2i\alpha \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-m_j(x+2l)} e^{-tx} dx = 4\pi F_{40}(y) \end{aligned} \quad (3.1.111)$$

If the expression of  $q_4(\alpha)$  given in (3.1.86) is substituted into (3.1.111) one obtains,

$$\begin{aligned} & \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \left[ i\alpha \left( \sum_{j=1}^4 K_j m_j R_j(\alpha) e^{m_j x} + \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-m_j x} \right) + \right. \\ & \quad \left. \frac{i}{2} \text{sign}(\alpha) q_4(\alpha) e^{-|\alpha|x} \right] e^{-tx} dx - \\ & \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \frac{i}{2} \text{sign}(\alpha) \int_{-\sqrt{c}}^{+\sqrt{c}} G_4(t) e^{t\alpha(t-y)} e^{-|\alpha|x} dt dx - \\ & \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} 2i\alpha \sum_{j=5}^8 K_j m_j R_j(\alpha) e^{-m_j(x+2l)} e^{-tx} dx = 4\pi F_{40}(y) \end{aligned} \quad (3.1.112)$$

By changing the order of integration, (3.1.112) can be rewritten as

$$\begin{aligned}
& \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} \left[ i\alpha \left( \sum_{j=1}^4 K_{j,m_j} R_j(\alpha) e^{m_j x} + \sum_{j=5}^8 K_{j,m_j} R_j(\alpha) e^{-m_j x} \right) + \right. \\
& \quad \left. \frac{i}{2} \operatorname{sign}(\alpha) q_4(\alpha) e^{-|\alpha|x} \right] e^{-\alpha y} d\alpha - \\
& \lim_{x \rightarrow 0^+} \int_{-\sqrt{c}}^{+\sqrt{c}} G_4(t) dt \int_{-\infty}^{+\infty} \frac{i}{2} \operatorname{sign}(\alpha) e^{\alpha(t-y)} e^{-|\alpha|x} d\alpha - \\
& \lim_{x \rightarrow 0^+} \int_{-\infty}^{+\infty} 2i\alpha \sum_{j=5}^8 K_{j,m_j} R_j(\alpha) e^{-m_j(x+2t)} e^{-\alpha y} d\alpha = 4\pi F_{40}(y)
\end{aligned} \tag{3.1.113}$$

Finally, by evaluating the second integral as follows

$$\int_{-\infty}^{+\infty} \frac{i}{2} \operatorname{sign}(\alpha) e^{\alpha(t-y)} e^{-|\alpha|x} d\alpha = - \int_0^{\infty} \sin[\alpha(t-y)] e^{-\alpha x} d\alpha = - \frac{(t-y)}{(t-y)^2 + x^2} \tag{3.1.114}$$

and by taking the limit  $x \rightarrow 0^+$ , the singular integral equation (3.1.113) is reduced to the following form

$$\begin{aligned}
& \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_4(t)}{(t-y)} dt + \int_{-\infty}^{+\infty} \left[ i\alpha \sum_{j=1}^8 K_{j,m_j} R_j + \frac{i}{2} \operatorname{sign}(\alpha) q_4(\alpha) \right] e^{-i\alpha y} d\alpha - \\
& \int_{-\infty}^{+\infty} 2i\alpha \sum_{j=5}^8 K_{j,m_j} R_j e^{-2m_j t} e^{-i\alpha y} d\alpha = 4\pi F_{40}(y), \quad -\sqrt{c} < y < \sqrt{c}
\end{aligned} \tag{3.1.115}$$

where the second and third integrals are now uniformly convergent. Finally by using (3.1.88), the equation (3.1.115) is reduced to the following form

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_4(t)}{(t-y)} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{4j}(y,t) G_j(t) dt = 4\pi F_{40}(y), \quad -\sqrt{c} < y < \sqrt{c} \tag{3.1.116}$$

Similarly, the remaining integral equations can be reduced to the following singular integral equations.

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_1(t)}{(t-y)} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{1j}(y,t) G_j(t) dt = 4\pi F_{10}(y), \quad -\sqrt{c} < y < \sqrt{c} \tag{3.1.117}$$

$$\frac{1-\nu^2}{\lambda^4} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_2(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{2j}(y,t) G_j(t) dt = 4\pi \frac{h}{a} F_{20}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (3.1.118)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_3(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{3j}(y,t) G_j(t) dt = 2\pi F_{30}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (3.1.119)$$

$$\frac{1-\nu^2}{\lambda^4} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_5(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{5j}(y,t) G_j(t) dt = 4\pi \frac{h}{a} F_{50}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (3.1.120)$$

where the kernels  $k_{ij}(y,t)$  ( $i,j=1,\dots,5$ ) are bounded in the interval  $-\sqrt{c} \leq (y,t) \leq \sqrt{c}$  and their expressions can be found in Appendix B. To complete the formulation of the problem, one must also require the single-valuedness of the rotations and displacements. In order to get the continuity of the displacements outside the crack,  $G_1, \dots, G_5$  must satisfy the following conditions:

$$\int_{-\sqrt{c}}^{+\sqrt{c}} G_1(t) dt = 0 \quad (3.1.121)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} G_2(t) dt = 0 \quad (3.1.122)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} G_3(t) dt = 0 \quad (3.1.123)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \left[ G_4(t) + \left( \frac{\lambda_2}{\lambda} \right)^2 t G_5(t) \right] dt = 0 \quad (3.1.124)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} G_5(t) dt = 0 \quad (3.1.125)$$

Thus, by solving the singular integral equations (3.1.116)-(3.1.120) with the single-valuedness conditions (3.1.121)-(3.1.125), the unknown functions  $G_j(y)$ , ( $j=1,\dots,5$ ) can be found.

### 3.2 Numerical Solution Method

To solve the system of singular integral equations, (3.1.105)-(3.1.109), the quadrature technique given in [22] will be used.

It is convenient to apply the technique to these singular integral equations, they should be normalized. To do so, the following normalized quantities are introduced:

$$\tau = t/\sqrt{c}, \quad -\sqrt{c} < t < \sqrt{c} \\ -1 < \tau < 1 \quad (3.2.1)$$

$$\eta = y/\sqrt{c}, \quad -\sqrt{c} < t < \sqrt{c} \\ -1 < \eta < 1 \quad (3.2.2)$$

$$\rho = x/\sqrt{c}, \quad -\infty < x < \infty \\ -\infty < \rho < \infty \quad (3.2.3)$$

$$H_i(\tau) = G_i(\sqrt{c}\tau), \quad (i=1,\dots,5) \quad (3.2.4)$$

By using the normalized quantities given in (3.2.1)-(3.2.4), the equations (3.1.105)-(3.1.114) can be rewritten as follows

$$\int_{-1}^1 \frac{H_1(\tau)}{\tau - \eta} d\tau + \sqrt{c} \int_{-1}^1 \sum_{j=1}^5 k_{1j}(\sqrt{c}\eta, \sqrt{c}\tau) H_j(\tau) d\tau = 4\pi F_{10}(\sqrt{c}\eta), \\ -1 < \eta < 1 \quad (3.2.5)$$

$$\frac{1-v^2}{\lambda^4} \int_{-1}^1 \frac{H_2(\tau)}{\tau - \eta} d\tau + \sqrt{c} \int_{-1}^1 \sum_{j=1}^5 k_{2j}(\sqrt{c}\eta, \sqrt{c}\tau) H_j(\tau) d\tau = 4\pi \frac{h}{a} F_{20}(\sqrt{c}\eta), \\ -1 < \eta < 1 \quad (3.2.6)$$

$$\int_{-1}^1 \frac{H_3(\tau)}{\tau - \eta} d\tau + \sqrt{c} \int_{-1}^1 \sum_{j=1}^5 k_{3j}(\sqrt{c}\eta, \sqrt{c}\tau) H_j(\tau) d\tau = 2\pi F_{30}(\sqrt{c}\eta) ,$$

$$-1 < \eta < 1 \quad (3.2.7)$$

$$\int_{-1}^1 \frac{H_4(\tau)}{\tau - \eta} d\tau + \sqrt{c} \int_{-1}^1 \sum_{j=1}^5 k_{4j}(\sqrt{c}\eta, \sqrt{c}\tau) H_j(\tau) d\tau = 4\pi F_{40}(\sqrt{c}\eta) ,$$

$$-1 < \eta < 1 \quad (3.2.8)$$

$$\frac{1 - \nu^2}{\lambda^4} \int_{-1}^1 \frac{H_5(\tau)}{\tau - \eta} d\tau + \sqrt{c} \int_{-1}^1 \sum_{j=1}^5 k_{5j}(\sqrt{c}\eta, \sqrt{c}\tau) H_j(\tau) d\tau = 4\pi \frac{h}{a} F_{50}(\sqrt{c}\eta) ,$$

$$-1 < \eta < 1 \quad (3.2.9)$$

$$\int_{-1}^1 H_1(\tau) d\tau = 0 \quad (3.2.10)$$

$$\int_{-1}^1 H_2(\tau) d\tau = 0 \quad (3.2.11)$$

$$\int_{-1}^1 H_3(\tau) d\tau = 0 \quad (3.2.12)$$

$$\int_{-1}^1 \left[ H_4(\tau) + \left( \frac{\lambda_2}{\lambda} \right)^2 \sqrt{c} \tau H_3(\tau) \right] d\tau = 0 \quad (3.2.13)$$

$$\int_{-1}^1 H_5(\tau) d\tau = 0 \quad (3.2.14)$$

In equations (3.2.5)-(3.2.9), the kernels  $k_{ij}$  ( $i, j=1, \dots, 5$ ) are in the form of infinite integrals. To evaluate these integrals, it is possible to use one of the known integration techniques. However, before evaluating the value of the integrals, it is possible to find the asymptotic value of the integrand as the variable of integration approaches infinity. From the asymptotic analysis, it is found that the integrands of

the kernels are not exponentially decaying functions for large values of the variable of the integration. To be able to cope with the convergency problem, these infinite integrals will be evaluated as follows,

$$I = \int_0^A F(\alpha) d\alpha + \int_A^\infty \Phi(\alpha) d\alpha \quad (3.2.15)$$

where A is a large enough number and  $\Phi(\alpha)$  is the asymptotic value of  $F(\alpha)$  as  $\alpha \rightarrow \infty$ . To solve the problem, in addition to numerical evaluation of the first integral in equation (3.2.15), the values of the second integral is found in closed form by sine and cosine integral as stated in [23]. Further details of the evaluation of  $\Phi(\alpha)$  is given in Appendix D.

The crack tips,  $\tau = \pm 1$ , are the points of singularity. Behavior of the unknown functions  $H_j$  ( $j=1, \dots, 5$ ) in the neighborhood of these singular points is one of the main objectives in solving the problem. Since the unknown functions  $H_j(\tau)$  ( $j=1, \dots, 5$ ) are infinite but integrable at  $\tau = \pm 1$ , the index of equations (3.2.5)-(3.2.9) is +1. The fundamental functions  $G_j(\tau)$  will then be in the following form [22]

$$H_j(\tau) = h_j(\tau)(1-\tau^2)^{-1/2}, \quad (j=1, \dots, 5) \quad (3.2.16)$$

where  $h_j(\tau)$  ( $j=1, \dots, 5$ ) are bounded in  $-1 \leq \tau \leq 1$ . Observing that  $(1-\tau^2)^{-1/2}$  is the weight of Chebyshev polynomials of the first kind and applying the Gauss-Chebyshev integration formulas, equations (3.2.5)-(3.2.14) can be reduced to the following set of simultaneous algebraic equations:

$$\sum_{j=1}^n \left[ \frac{h_1(\tau_j)}{\tau_j - \eta_i} + \sqrt{c} \sum_{m=1}^5 k_{1m}(\sqrt{c}\eta_i, \sqrt{c}\tau_j) h_m(\tau_j) \right] w_j = 4\pi F_{10}(\sqrt{c}\eta_i), \quad i=1, \dots, n-1 \quad (3.2.17)$$

$$\sum_{j=1}^n \left[ \frac{1-\nu^2}{\lambda^4} \frac{h_2(\tau_j)}{\tau_j - \eta_i} + \sqrt{c} \sum_{m=1}^5 k_{2m}(\sqrt{c}\eta_i, \sqrt{c}\tau_j) h_m(\tau_j) \right] w_j = 4\pi \frac{h}{a} F_{20}(\sqrt{c}\eta_i), \quad i=1, \dots, n-1 \quad (3.2.18)$$

$$\sum_{j=1}^n \left[ \frac{h_3(\tau_j)}{\tau_j - \eta_i} + \sqrt{c} \sum_{m=1}^5 k_{3m}(\sqrt{c}\eta_i, \sqrt{c}\tau_j) h_m(\tau_j) \right] \omega_j = 2\pi F_{30}(\sqrt{c}\eta_i),$$

$$i = 1, \dots, n-1 \quad (3.2.19)$$

$$\sum_{j=1}^n \left[ \frac{h_4(\tau_j)}{\tau_j - \eta_i} + \sqrt{c} \sum_{m=1}^5 k_{4m}(\sqrt{c}\eta_i, \sqrt{c}\tau_j) h_m(\tau_j) \right] \omega_j = 4\pi F_{40}(\sqrt{c}\eta_i),$$

$$i = 1, \dots, n-1 \quad (3.2.20)$$

$$\sum_{j=1}^n \left[ \frac{1-v^2}{\lambda^4} \frac{h_5(\tau_j)}{\tau_j - \eta_i} + \sqrt{c} \sum_{m=1}^5 k_{5m}(\sqrt{c}\eta_i, \sqrt{c}\tau_j) h_m(\tau_j) \right] \omega_j = 4\pi F_{50}(\sqrt{c}\eta_i),$$

$$i = 1, \dots, n-1 \quad (3.2.21)$$

$$\sum_{j=1}^n h_1(\tau_j) \omega_j = 0 \quad (3.2.22)$$

$$\sum_{j=1}^n h_2(\tau_j) \omega_j = 0 \quad (3.2.23)$$

$$\sum_{j=1}^n h_3(\tau_j) \omega_j = 0 \quad (3.2.24)$$

$$\sum_{j=1}^n \left[ h_4(\tau_j) + \left( \frac{\lambda_2}{\lambda} \right)^2 \sqrt{c} \tau_j h_3(\tau_j) \right] \omega_j = 0 \quad (3.2.25)$$

$$\sum_{j=1}^n h_5(\tau_j) \omega_j = 0 \quad (3.2.26)$$

where

$$\tau_j = \cos\left(\pi \frac{j-1}{n-1}\right), \quad j = 1, \dots, n \quad (3.2.27)$$

$$\eta_i = \cos\left(\pi \frac{2i-1}{2n-2}\right), \quad i = 1, \dots, n-1 \quad (3.2.28)$$

$$w_1 = w_n = \frac{\pi}{2(n-1)}, \quad w_j = \frac{\pi}{n-1}, \quad j=2, \dots, n-1 \quad (3.2.29)$$

By solving the set of  $5n$  simultaneous algebraic equations given in (3.2.17)-(3.2.26),  $5n$  discrete values for  $h_i(\tau_j)$  ( $i=1, \dots, 5; j=1, \dots, n$ ) can be found. By using these values, it is possible to find every physical quantities of the problem.

### 3.3 Asymptotic Fields Around the Crack Tips

In order to obtain the asymptotic stress field in a neighborhood of the crack tip, the following formula is used [24]

$$\int_{-1}^1 \frac{h(\tau)}{\sqrt{1-\tau^2}} e^{i\alpha\tau} d\tau = \left( \frac{\pi}{2|\alpha|} \right)^{1/2} \left\{ h(1) \exp \left[ i \left( \alpha - \frac{\pi}{4} \frac{\alpha}{|\alpha|} \right) \right] + h(-1) \exp \left[ -i \left( \alpha - \frac{\pi}{4} \frac{\alpha}{|\alpha|} \right) \right] + O\left( \frac{1}{|\alpha|} \right) \right\}, \quad (|\alpha| \rightarrow \infty) \quad (3.3.1)$$

Using the asymptotic expansions of  $m_j$  ( $j=1, \dots, 8$ ),  $n_j$  ( $j=1, \dots, 4$ ),  $r_1$ ,  $r_2$  and  $t_1$  given in (3.1.99)-(3.1.104) and equations (3.3.1), (3.1.45)-(3.1.52), one can obtain the asymptotic expressions for stress and moment resultants around the crack tip  $\eta=1$ ,  $\rho=0$ . The leading terms of the asymptotic stress and moment resultants may be expressed as

$$N_{xx} \equiv \frac{h_1(1)}{4\sqrt{2\pi_0}} \int_0^\infty \frac{1}{\sqrt{\alpha}} (1 + \alpha|\rho|) e^{-\alpha|\rho|} \sin \left[ \alpha(1-\eta) - \frac{\pi}{4} \right] d\alpha, \quad (3.3.2)$$

$$N_{yy} \equiv \frac{h_1(1)}{4\sqrt{2\pi_0}} \int_0^\infty \frac{1}{\sqrt{\alpha}} (1 - \alpha|\rho|) e^{-\alpha|\rho|} \sin \left[ \alpha(1-\eta) - \frac{\pi}{4} \right] d\alpha, \quad (3.3.3)$$

$$N_{xy} \equiv \frac{h_4(1)}{4\sqrt{2\pi_0}} \int_0^\infty \frac{1}{\sqrt{\alpha}} (1 - \alpha|\rho|) e^{-\alpha|\rho|} \sin \left[ \alpha(1-\eta) - \frac{\pi}{4} \right] d\alpha, \quad (3.3.4)$$

$$M_{xx} \equiv \frac{h}{12a} \frac{h_2(1)}{4\sqrt{2\pi_0}} \int_0^{\infty} \frac{1}{\sqrt{\alpha}} (1 + \alpha|\rho|) e^{-\alpha|\rho|} \sin\left[\alpha(1-\eta) - \frac{\pi}{4}\right] d\alpha, \quad (3.3.5)$$

$$M_{yy} \equiv \frac{h}{12a} \frac{h_2(1)}{4\sqrt{2\pi_0}} \int_0^{\infty} \frac{1}{\sqrt{\alpha}} (1 - \alpha|\rho|) e^{-\alpha|\rho|} \sin\left[\alpha(1-\eta) - \frac{\pi}{4}\right] d\alpha, \quad (3.3.6)$$

$$M_{xy} \equiv \frac{h}{12a} \frac{h_3(1)}{4\sqrt{2\pi_0}} \int_0^{\infty} \frac{1}{\sqrt{\alpha}} (1 - \alpha|\rho|) e^{-\alpha|\rho|} \sin\left[\alpha(1-\eta) - \frac{\pi}{4}\right] d\alpha, \quad (3.3.7)$$

$$V_x \equiv \frac{h_3(1)}{2\sqrt{2\pi_0}} \int_0^{\infty} \frac{e^{-\alpha|\rho|}}{\sqrt{\alpha}} \sin\left[\alpha(1-\eta) - \frac{\pi}{4}\right] d\alpha, \quad (3.3.8)$$

$$V_y \equiv \frac{h_3(1)}{2\sqrt{2\pi_0}} \int_0^{\infty} \frac{e^{-\alpha|\rho|}}{\sqrt{\alpha}} \cos\left[\alpha(1-\eta) - \frac{\pi}{4}\right] d\alpha \quad (3.3.9)$$

Defining the new coordinates  $r, \theta$  in  $\eta, \rho$  plane by  $\rho = r \sin \theta$ ,  $\eta - 1 = r \cos \theta$  and using the relation [25]

$$\int_0^{\infty} z^{\mu-1} e^{-sz} \begin{Bmatrix} \sin \\ \cos \end{Bmatrix} (rz) dz = \frac{\Gamma(\mu)}{(s^2 + r^2)^{\mu/2}} \begin{Bmatrix} \sin \\ \cos \end{Bmatrix} \left( \mu \tan^{-1} \frac{r}{s} \right), \quad (s > 0, \mu > 0) \quad (3.3.10)$$

equations (3.3.2)-(3.3.9) can be reduced to the following form

$$N_{xx} = -\frac{h_1(1)}{4\sqrt{2r}} \left[ \frac{5}{4} \cos \frac{\theta}{2} - \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.11)$$

$$N_{yy} = -\frac{h_1(1)}{4\sqrt{2r}} \left[ \frac{3}{4} \cos \frac{\theta}{2} + \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.12)$$

$$N_{xy} = -\frac{h_4(1)}{4\sqrt{2r}} \left[ \frac{3}{4} \cos \frac{\theta}{2} + \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.13)$$

$$M_{xx} = -\frac{h_2(1)}{4\sqrt{2r}} \frac{h}{12a} \left[ \frac{5}{4} \cos \frac{\theta}{2} - \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.14)$$

$$M_{yy} = -\frac{h_2(1)}{4\sqrt{2r}} \frac{h}{12a} \left[ \frac{3}{4} \cos \frac{\theta}{2} + \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.15)$$

$$M_{xy} = -\frac{h_3(1)}{4\sqrt{2r}} \frac{h}{12a} \left[ \frac{3}{4} \cos \frac{\theta}{2} + \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.16)$$

$$V_x = -\frac{h_3(1)}{2\sqrt{2r}} \cos \frac{\theta}{2}, \quad (3.3.17)$$

$$V_y = \frac{h_3(1)}{2\sqrt{2r}} \sin \frac{\theta}{2} \quad (3.3.18)$$

By observing that the membrane and bending components of the stresses are given by (see Appendix A)

$$\sigma_{ij}^m = N_{ij}, \quad \sigma_{ij}^b = \frac{12az}{h} M_{ij}, \quad (i, j = x, y) \quad (3.3.19)$$

from equations (3.3.11)-(3.3.16), the asymptotic stress distribution may be obtained as,

$$\sigma_{xx} = -\frac{h_1(1) + zh_2(1)}{4\sqrt{2r}} \left[ \frac{5}{4} \cos \frac{\theta}{2} - \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.20)$$

$$\sigma_{yy} = -\frac{h_1(1) + zh_2(1)}{4\sqrt{2r}} \left[ \frac{3}{4} \cos \frac{\theta}{2} + \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.21)$$

$$\sigma_{xy} = -\frac{h_4(1) + zh_5(1)}{4\sqrt{2r}} \left[ \frac{3}{4} \cos \frac{\theta}{2} + \frac{1}{4} \cos \frac{5\theta}{2} \right], \quad (3.3.22)$$

similarly, for the transverse shear stresses by using

$$\sigma_z = \frac{3}{2} V_i \left[ 1 - \left( \frac{az}{h/2} \right)^2 \right], \quad (i=x,y) \quad (3.3.23)$$

the following asymptotic stress distribution can be found

$$\sigma_{xz} = -\frac{3}{2} \frac{h_3(1)}{2\sqrt{2r}} \cos \frac{\theta}{2} \left[ 1 - \left( \frac{az}{h/2} \right)^2 \right], \quad (3.3.24)$$

$$\sigma_{yz} = -\frac{3}{2} \frac{h_3(1)}{2\sqrt{2r}} \sin \frac{\theta}{2} \left[ 1 - \left( \frac{az}{h/2} \right)^2 \right] \quad (3.3.25)$$

### 3.4 Numerical Results and Discussion

For the problem under consideration, Modes I, II and III stress intensity factors at the crack tip are defined by:

$$k_j(x_3) = \lim_{x_2 \rightarrow a} \sqrt{2(x-a)} \sigma_{1j}(0, x_2, x_3), \quad (j=1,2,3) \quad (3.4.1)$$

Then, from equations (3.3.20), (3.3.22), (3.3.24) and Appendix A, the stress intensity factors can be written as

$$k_1(x_3) = -\frac{cE}{4} \sqrt{a} \left[ h_1(1) + \frac{x_3}{a} h_2(1) \right], \quad (3.4.2)$$

$$k_2(x_3) = -\frac{E}{4} \sqrt{a} \left[ h_4(1) + \frac{x_3}{a} h_5(1) \right], \quad (3.4.3)$$

$$k_3(x_3) = -\frac{3}{4} B \sqrt{a} \sqrt{c} h_3(1) \left[ 1 - \left( \frac{x_3}{h/2a} \right)^2 \right], \quad (3.4.4)$$

The main interest in this study is the evaluation of the stress intensity factors in shells for various crack geometries and loading conditions. For each crack geometry the problem is solved by assuming only one of the possible crack surface loadings to be non zero at a time. For a general loading the results may then be obtained by superposition. From (3.4.2) and (3.4.3) it is seen that the in-plane stress intensity factors  $k_1$  and  $k_2$  have "membrane" and "bending" components, since  $h_1$  and  $h_4$  are related to the membrane and  $h_2$  and  $h_5$  are related to the bending stresses. For simplicity, the related stress intensity factors are defined separately. The calculated results are normalized with respect to a standard stress intensity factor  $\sigma_j \sqrt{a}$  ( $j=1, \dots, 5$ ) where  $\sigma_j$  stands for any of the following five nominal ("membrane", "bending", "transverse shear", "in-plane shear" and "twisting") stresses:

$$\sigma_1 = \frac{N_{11}}{h}, \quad \sigma_2 = \frac{6M_{11}}{h^2}, \quad \sigma_3 = \frac{3V_1}{2h}, \quad \sigma_4 = \frac{N_{12}}{h}, \quad \sigma_5 = \frac{6M_{12}}{h^2} \quad (3.4.5)$$

where crack lies in  $X_2X_3$  plane and  $N_{11}$ ,  $M_{11}$ ,  $V_1$ ,  $N_{12}$  and  $M_{12}$  are the crack surface tractions.

The normalized stress intensity factors are then defined and calculated in terms of  $h_j(1)$  ( $j=1, \dots, 5$ ) as follows:

$$k_{mm} = \frac{k_1(0)}{\sigma_1 \sqrt{a}} = -\frac{cE}{4\sigma_1} h_1(1), \quad (3.4.6)$$

$$k_{bm} = \frac{k_2(0)}{\sigma_2 \sqrt{a}} = -\frac{cE}{4\sigma_2} h_1(1), \quad (3.4.7)$$

$$k_{mb} = \frac{k_1(h/2) - k_1(0)}{\sigma_1 \sqrt{a}} = -\frac{cE}{4\sigma_1} \frac{h}{2a} h_2(1), \quad (3.4.8)$$

$$k_{bb} = \frac{k_2(h/2) - k_2(0)}{\sigma_2 \sqrt{a}} = -\frac{cE}{4\sigma_2} \frac{h}{2a} h_2(1), \quad (3.4.9)$$

$$k_w = \frac{k_3(0)}{\sigma_3 \sqrt{a}} = -\frac{3 B}{4 \sigma_3} \sqrt{c} h_3(1) , \quad (3.4.10)$$

$$k_{sv} = \frac{k_3(0)}{\sigma_4 \sqrt{a}} = -\frac{3 B}{4 \sigma_4} \sqrt{c} h_3(1) , \quad (3.4.11)$$

$$k_w = \frac{k_3(0)}{\sigma_5 \sqrt{a}} = -\frac{3 B}{4 \sigma_5} \sqrt{c} h_3(1) , \quad (3.4.12)$$

$$k_{us} = \frac{k_2(0)}{\sigma_3 \sqrt{a}} = -\frac{E}{4 \sigma_3} h_4(1) , \quad (3.4.13)$$

$$k_{ss} = \frac{k_2(0)}{\sigma_4 \sqrt{a}} = -\frac{E}{4 \sigma_4} h_4(1) , \quad (3.4.14)$$

$$k_{us} = \frac{k_2(0)}{\sigma_5 \sqrt{a}} = -\frac{E}{4 \sigma_5} h_4(1) , \quad (3.4.15)$$

$$k_{us} = \frac{k_2(h/2) - k_2(0)}{\sigma_3 \sqrt{a}} = -\frac{E}{4 \sigma_3} \frac{h}{2a} h_5(1) , \quad (3.4.16)$$

$$k_{ss} = \frac{k_2(h/2) - k_2(0)}{\sigma_4 \sqrt{a}} = -\frac{E}{4 \sigma_4} \frac{h}{2a} h_5(1) , \quad (3.4.17)$$

$$k_{us} = \frac{k_2(h/2) - k_2(0)}{\sigma_5 \sqrt{a}} = -\frac{E}{4 \sigma_5} \frac{h}{2a} h_5(1) \quad (3.4.18)$$

where for each individual loading  $\sigma_j$  is given by (3.4.5). In the case of uniform crack surface loads  $N_{11}$ ,  $M_{11}$ ,  $V_1$ ,  $N_{12}$  and  $M_{12}$ , referring to (3.1.40a)-(3.1.44a), Appendix A, and (3.4.5) the input functions of the system of integral equations (3.1.105)-(3.1.109) are given by

$$\begin{aligned}
F_{10}(y) &= \frac{\sigma_1}{cE}, \quad F_{20}(y) = \frac{\sigma_2}{6cE}, \quad F_{30}(y) = \frac{2}{3} \frac{\sigma_3}{B\sqrt{c}}, \\
F_{40}(y) &= \frac{\sigma_4}{6E}, \quad F_{50}(y) = \frac{\sigma_5}{6E},
\end{aligned} \tag{3.4.19}$$

The normalized stress intensity factors are obtained for various values of the dimensionless length parameters  $h/R$ ,  $a/h$  and  $l/a$  of the problem and they are given in Tables 1 through 13 and Figures 5 through 15. In all of these examples it is assumed that the material is isotropic and Poisson's ratio is  $\nu=0.3$ . To show the material orthotropy on the stress intensity factors, graphite, a strongly orthotropic material, is considered and results are given in Table 15 for  $l/a=0.5$ ,  $a/h=1$  and  $R/h=10$ . Also the effect of Poisson's ratio on the stress intensity factors is analyzed and results are tabulated in Table 14 for  $l/a=0.5$ ,  $a/h=1$  and  $R/h=5$ .

From the Tables 1 through 15 and Figures 5 through 15, one can make the following observations:

As  $l/a \rightarrow \infty$ , the values of the stress intensity factor ratios are in excellent agreement with the results given for infinite cylinder in [9] and [13].

If the crack surface is under the effect of uniform membrane loading, the membrane component of the stress intensity factor ratio,  $k_{mm}$  is larger than  $k_{bm}$ . The value of  $k_{mm}$  increases with decreasing  $R/h$  and increasing  $a/h$  ratios as shown in Table 1 and Figure 10. When the crack approaches to the fixed end, i.e.  $l/a$  gets smaller, significant increase in  $k_{mm}$  can be observed in Figure 5. For small  $a/h$  ratios, increase in  $k_{mm}$  is larger as the crack approaches to the fixed end.

If the crack surface is under uniform bending moment, the bending stress intensity factor ratio  $k_{bb}$  is the dominant one. The value of  $k_{bb}$  decreases with decreasing  $R/h$  and  $a/h$  ratios. The effect of the fixed end on  $k_{bb}$  decreases as crack length increases.

In the shell theories used the stress intensity factor in a shell containing a through crack and subjected to pure bending is found to be function of the thickness coordinate  $X_3$  meaning that for  $X_3 < 0$ , the stress intensity factor would be

negative. Therefore the through crack bending results would be meaningful only if the shell is also under tension and the applied loads satisfy following inequality

$$\frac{\sigma_1}{\sigma_2} \geq \frac{k_1^b(h/2)}{\sigma_2^\infty \sqrt{a}} \quad (3.4.20)$$

It is then clear that if the shell under pure bending or if the tensile stress is not sufficiently high to satisfy the above inequality, the crack surfaces may be in contact on the compression side. In this case the problem may be treated as a part-through crack problem with the crack forming a cusp along the boundary of contact region.

Equations (3.2.7), (3.2.8) and (3.2.9), respectively, correspond to transverse shear, uniform in-plane shear and twisting moment loading of the shell with a fixed end containing a circumferential crack. Since the integral equations are coupled, for each loading there will be a primary and two secondary stress intensity factors. In each case primary stress intensity factor are normalized with respect to both secondary stress intensity factors and primary stress intensity factor obtained from the corresponding two dimensional elasticity solution of the infinite plate with a central crack problem.

In the case of uniform transverse shear loading, the twisting moment component and the transverse shear component of the stress intensity factor ratios  $k_{\nu}$  and  $k_{\nu\nu}$  are the dominant factors, and  $k_{\nu\nu}$  increases with increasing  $R/h$ . For large  $a/h$  ratios, as crack gets closer to fixed end,  $k_{\nu\nu}$  values decrease. For small  $a/h$  ratios, a weak interaction between fixed end and circumferential crack can be observed in Figure 7.

Tables 8 through 10 show some sample results for a cylindrical shell subjected to uniform membrane shear loading  $N_{12}^\infty$  away from the crack region. This represents by far the most important antisymmetric loading in practice as in, for example, cylinders subjected to torsion. The stress intensity factor ratio  $k_{ss}$  is the dominant component and its value increases as  $h/R$  and  $a/h$  increases. As  $l/a$  ratio gets smaller,  $k_{ss}$  values increase and as  $l/a$  gets larger, it asymptotically approaches the results obtained for infinite cylindrical shells.

In the case of twisting moment, the twisting component of the stress intensity factor ratio  $k_{tt}$  is the dominant one and its value is practically insensitive to the change in  $h/R$  ratio but it increases with decreasing  $a/h$  values. The effect of the fixed end in reducing the stress intensity factor  $k_{tt}$  can be observed in Figure 14.

The effect of Poisson's ratio  $\nu$  on the stress intensity factors for a specific geometry  $a/h=1$ ,  $R/h=5$  and  $l/a=0.5$  is shown in Table 14. From the table the effect of Poisson's ratio on the primary stress intensity factors does not seem to be very significant. Even though under membrane loading, the effect of  $\nu$  (varying between 0 and 0.5) on  $k_{bm}$  may be as high as 40% , for practical variations in  $\nu$  and for most crack geometries, the influence of Poisson's ratio is not expected to be significant.

It should be noted that the Poisson's ratio  $\nu$  in isotropic shells and  $\nu = \sqrt{\nu_1 \nu_2}$  and orthotropy parameter  $c = (E_1/E_2)^{1/4}$  in specially orthotropic shells appear in the expressions of the kernels of the integral equations. Thus, in general, to investigate the effect of the material orthotropy on the stress intensity factors both  $\nu$  and  $c$  must be varied. However, as seen from table 14, the influence of  $\nu$  is rather insignificant. Therefore, to study the effect of material orthotropy it may be sufficient to vary  $c$  only. The effect of material orthotropy on the stress intensity factors is shown in Table 15 for  $a/h=1$ ,  $R/h=10$  and  $l/a=0.5$ . It is seen that all stress intensity factor ratios are affected considerably by the material orthotropy. Except, the twisting component of stress intensity factor ratio,  $k_{tt}$ , when  $E_1 / E_2 < 1$  the values of stress intensity factor ratios are smaller than that of isotropic case, and if  $E_1 / E_2 > 1$  then they are larger than that of isotropic case.

## CHAPTER IV

### A CYLINDRICAL SHELL WITH A FIXED END WHICH CONTAINS A CIRCUMFERENTIAL PART-THROUGH CRACK

In this part of the study, a cylindrical shell with a fixed end which contains a circumferential part-through crack subjected to the five possible loadings is considered. The problem will be treated by using the line-spring model [17].

The local geometry of the surface crack for the cylindrical shell under consideration is shown in Figure 2. Let  $\sigma_{ij}^n(0, X_2, X_3)$ , ( $j=1,2,3$ ) be the stresses acting on the net ligament ( $X_1 = 0$ ,  $-a < X_2 < a$ ,  $-h/2 < X_3 < [h/2 - l(X_2)]$ ). Let the net ligament stresses  $\sigma_{ij}^n$  be statically equivalent to the resultants  $N_{11}(0, X_2)$ ,  $M_{11}(0, X_2)$ ,  $V_1(0, X_2)$ ,  $N_{12}(0, X_2)$ ,  $M_{12}(0, X_2)$  acting on the neutral surface  $X_3 = 0$  along ( $X_1 = 0$ ,  $-a < X_2 < a$ ). Note that in expressing the boundary conditions for the three dimensional surface crack problem the conditions of zero displacements on the uncracked part of the boundary  $X_1 = 0$  may be replaced by the traction boundary conditions  $\sigma_{ij}(0, X_2, X_3) = \sigma_{ij}^n(0, X_2, X_3)$ , provided that  $\sigma_{ij}^n$  are known. One of the major assumptions in developing the line spring model is that the net ligament tractions  $\sigma_{ij}^n$  (which are unknown functions of  $X_2$  and  $X_3$ ) may be replaced by their statically equivalent resultants  $N_{11}$ ,  $M_{11}$ ,  $V_1$ ,  $N_{12}$  and  $M_{12}$  which are now functions of only one variable,  $X_2$ . This assumption also implies that, for the purpose of determining the unknown resultants, the part-through crack problem may be replaced by a through crack problem. If the following matrix is defined

$$\left[ F_i(y) \right]^T = \left\{ \frac{N_{11}}{Ehc}, \frac{M_{11}}{Eh^2c}, \frac{12(1+\nu)V_1}{5Eh\sqrt{c}}, \frac{N_{12}}{Eh}, \frac{M_{12}}{Eh^2} \right\}, \quad (i=1, \dots, 5) \quad (4.1)$$

by taking into consideration the contribution coming from the net ligament stresses, the system of singular integral equations (3.1.105)-(3.1.109) may now be modified as

Figure 2. Geometry of a Semi-Elliptical Part-Through Crack in a Shell

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_1(t)}{(t-y)} dt + \sum_{j=1}^s \int_{-\sqrt{c}}^{+\sqrt{c}} k_{1j}(y,t) G_j(t) dt = 4\pi [F_{10}(y) - F_1(y)] ,$$

$$-\sqrt{c} < y < \sqrt{c} \quad (4.2)$$

$$\frac{1-\nu^2}{\lambda^4} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_2(t)}{(t-y)} dt + \sum_{j=1}^s \int_{-\sqrt{c}}^{+\sqrt{c}} k_{2j}(y,t) G_j(t) dt = 4\pi \frac{h}{a} [F_{20}(y) - F_2(y)] ,$$

$$-\sqrt{c} < y < \sqrt{c} \quad (4.3)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_3(t)}{(t-y)} dt + \sum_{j=1}^s \int_{-\sqrt{c}}^{+\sqrt{c}} k_{3j}(y,t) G_j(t) dt = 2\pi [F_{30}(y) - F_3(y)] ,$$

$$-\sqrt{c} < y < \sqrt{c} \quad (4.4)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_4(t)}{(t-y)} dt + \sum_{j=1}^s \int_{-\sqrt{c}}^{+\sqrt{c}} k_{4j}(y,t) G_j(t) dt = 4\pi [F_{40}(y) - F_4(y)] ,$$

$$-\sqrt{c} < y < \sqrt{c} \quad (4.5)$$

$$\frac{1-\nu^2}{\lambda^4} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_5(t)}{(t-y)} dt + \sum_{j=1}^s \int_{-\sqrt{c}}^{+\sqrt{c}} k_{5j}(y,t) G_j(t) dt = 4\pi \frac{h}{a} [F_{50}(y) - F_5(y)] ,$$

$$-\sqrt{c} < y < \sqrt{c} \quad (4.6)$$

To solve the integral equations (4.2)-(4.6), the two sets of unknown functions  $G_j$  and  $F_j$  ( $j=1, \dots, 5$ ) must be somehow related. The key to this relationship is another important assumption made in developing the model to the effect that the stress intensity factors at a location  $X_2$  along the crack front (Figure 3) may be approximated by the corresponding Modes I, II and III values obtained from the plane elasticity solution of a strip containing an edge crack of depth  $l(X_2)$  and subjected to stress and moment resultants  $[N_{11}(X_2), M_{11}(X_2)]$ ,  $V_1(X_2)$  and  $[N_{12}(X_2), M_{12}(X_2)]$  away from the crack region. To obtain the relationship between the functions  $G_j$  and  $F_j$  ( $j=1, \dots, 5$ ), the energy  $G$  available for fracture along the crack front is expressed in two ways. First, it is noted that for coplanar crack growth  $G$  is equivalent to the crack closure energy per unit thickness which may be expressed in terms of the stress intensity factors as follows:

Figure 3. The Notation for a Part-Through Crack in Shells

$$G = \frac{\partial}{\partial l}(U - V) = \frac{\pi(1 - \nu^2)}{E} \left[ k_1^2 + k_2^2 + \frac{1}{1 - \nu} k_3^2 \right] \quad (4.7)$$

where  $U$  is the work done by the external loads,  $V$  is the strain energy, and  $k_1$ ,  $k_2$  and  $k_3$  are, respectively, the Modes I, II, and III stress intensity factor defined by (3.4.1).

Referring now to Figure 3, let  $\delta_i$  be the relative crack surface displacements and rotations corresponding to the resultants,  $f_i$  ( $i=1, \dots, 5$ ) defined by

$$\begin{aligned} \{f_i\}^T &= \{N_{11}, M_{11}, V_1, N_{12}, M_{12}\} \\ &= \left\{ EhcF_1, Ech^2F_2, \frac{5Eh\sqrt{c}}{12(1+\nu)}F_3, EhF_4, Eh^2F_5 \right\} \quad (i=1, \dots, 5) \end{aligned} \quad (4.8)$$

$$\{\delta_i\}^T = \{u_1^+ - u_1^-, \beta_1^+ - \beta_1^-, W^+ - W^-, u_2^+ - u_2^-, \beta_2^+ - \beta_2^-\} \quad (i=1, \dots, 5) \quad (4.9)$$

Also, let  $d\delta_i$  be the change in  $\delta_i$  ( $i=1, \dots, 5$ ) as the crack length increases from  $l + dl$  under "fixed load" conditions. From Figure 3 it may then be seen that the changes in  $U$  and  $V$  may be expressed as

$$dU = \sum_{i=1}^5 F_i d\delta_i, \quad (4.10)$$

$$dV = \sum_{i=1}^5 \left[ \frac{1}{2} F_i (\delta_i + d\delta_i) - \frac{1}{2} F_i \delta_i \right] = \frac{1}{2} \sum_{i=1}^5 F_i d\delta_i, \quad (4.11)$$

giving the energy available for crack growth  $dl$  as

$$d(U - V) = \frac{1}{2} \sum_{i=1}^5 F_i d\delta_i. \quad (4.12)$$

By observing that under constant loads,

$$d\delta_i = \frac{\partial \delta_i}{\partial l} dl, \quad (i=1, \dots, 5), \quad (4.13)$$

from (4.7), (4.12) and (4.13), it follows that

$$G = \frac{\partial}{\partial l}(U - V) = \frac{1}{2} \sum_{i=1}^5 F_i \frac{\partial \delta_i}{\partial l}, \quad (4.14)$$

and

$$\frac{1}{2} \sum_{i=1}^5 F_i \frac{\partial \delta_i}{\partial l} = \frac{\pi(1-\nu)}{E} \left[ k_1^2 + k_2^2 + \frac{1}{1-\nu} k_3^2 \right] \quad (4.15)$$

It will be now assumed that the plane edge crack problem under (uniform) resultants  $f_i$  away from the crack region shown in Figure 3 has been solved and the stress intensity factors are known as functions of  $l/h$ . Defining the stress amplitudes in the shell by

$$\begin{aligned} \{\sigma_i\}^T &= \left\{ \frac{N_{11}}{h}, \frac{6M_{11}}{h^2}, \frac{3V_1}{2h}, \frac{N_{12}}{h}, \frac{6M_{12}}{h^2} \right\} \\ &= \left\{ \frac{f_1}{h}, \frac{6f_2}{h^2}, \frac{3f_3}{2h}, \frac{f_4}{h}, \frac{6f_5}{h^2} \right\}, \quad (i=1, \dots, 5) \end{aligned} \quad (4.16)$$

we express the stress intensity factors as

$$k_1 = \sqrt{h} [\sigma_1 p_1(\xi) + \sigma_2 p_2(\xi)], \quad (4.17)$$

$$k_2 = \sqrt{h} [\sigma_3 p_3(\xi)], \quad (4.18)$$

$$k_3 = \sqrt{h} [\sigma_4 p_4(\xi) + \sigma_5 p_5(\xi)] \quad (4.19)$$

where  $\xi = l/h$  and  $p_i$  ( $i=1, \dots, 5$ ) are known functions given in Appendix E. From (4.7) and (3.4.1) it is seen that

$$G = \frac{\pi h(1-\nu^2)}{E} \left[ \sigma_1^2 p_1^2 + 2\sigma_1\sigma_2 p_1 p_2 + \sigma_2^2 p_2^2 + \sigma_3^2 p_3^2 + \frac{1}{1-\nu} (\sigma_4^2 p_4^2 + 2\sigma_4\sigma_5 p_4 p_5 + \sigma_5^2 p_5^2) \right] = \{\sigma\}^T [P] \{\sigma\} \quad (4.20)$$

The matrix  $\{\sigma\}$  is given by (4.16) and the square matrix  $[P]$  is defined by

$$[P] = \frac{\pi h(1-\nu^2)}{E} \begin{bmatrix} p_1^2 & p_1 p_2 & 0 & 0 & 0 \\ p_1 p_2 & p_2^2 & 0 & 0 & 0 \\ 0 & 0 & p_3^2 & 0 & 0 \\ 0 & 0 & 0 & p_4^2/(1-\nu) & p_4 p_5/(1-\nu) \\ 0 & 0 & 0 & p_4 p_5/(1-\nu) & p_5^2/(1-\nu) \end{bmatrix} \quad (4.21)$$

In terms of the matrices  $\{\delta\}$  and  $\{\sigma\}$  defined by (4.9) and (4.16) from (4.14),  $G$  may also be expressed as

$$G = \frac{1}{2} \{f\}^T \frac{\partial}{\partial l} \{\delta\} = \{\sigma\}^T \frac{1}{2} [d] \frac{\partial}{\partial l} \{\delta\} \quad (4.22)$$

where the diagonal matrix  $[d]$  is given by

$$[d] = \text{diag} \left[ h, h^2/6, 2h/3, h, h^2/6 \right] \quad (4.23)$$

From (4.20) and (4.22) it now follows that

$$\frac{1}{2} [d] \frac{\partial}{\partial l} \{\delta\} = [P] \{\sigma\} \quad (4.24)$$

By observing that  $[C]$  is constant,  $\{\delta\} = 0$  for  $l = 0$ ,  $[P]$  is a function of  $l$  and  $\{\sigma\}$  is independent of  $l$ , from (4.24), following expression can be obtained

$$\frac{1}{2} [c] \{\delta\} = \left( \int_0^l [P] dl \right) \{\sigma\} = h \left( \int_0^{\xi} [P(\xi)] d\xi \right) \{\sigma\} \quad (4.25)$$

From (4.21), if the following matrix is defined

$$[A] = [\alpha_{ij}] = \frac{E}{\pi h(1-\nu^2)} \int_0^{\xi} P(\xi) d\xi \quad (4.26)$$

$$\alpha_{ij} = \int_0^{\xi} p_i p_j d\xi, \quad (i, j=1,2) \text{ and } (i=j=3) \quad (4.27)$$

$$\alpha_{ij} = \int_0^{\xi} p_i p_j d\xi, \quad (i, j=4,5) \quad (4.28)$$

equation (4.25) becomes

$$\frac{E}{\pi h^2(1-\nu^2)} [A]^{-1} \frac{1}{2} [d] \{\delta\} = \{\sigma\} \quad (4.29)$$

which, considering the definitions of  $\{\sigma\}$  and  $\{F\}$  given by (4.16) and (4.1) and  $\{\delta\}$  and  $\{G\}$  given by (4.9) and (3.1.58)-(3.1.62) provides the needed relationship between  $\{F\}$  and  $\{G\}$ .

Equation (4.29) has the information that is needed for substitution into integral equations of the form of (4.2)-(4.6). First it must be non-dimensionalized. This is done according to the definitions in Appendix A.

Since the crack lies in a principal plane of curvature of the shell, the crack opening displacements and rotations become,

$$\delta_1 = 2|\mu_1|, \quad \delta_2 = 2|\beta_1|, \quad \delta_3 = 2|W|, \quad \delta_4 = 2|\mu_2|, \quad \delta_5 = 2|\beta_2| \quad (4.30)$$

Then, the final non-dimensional result is obtained as

$$F_1 = \frac{1}{\pi c^{3/2}(1-\nu^2)} \left( \gamma_{11} \frac{a}{h} u + \gamma_{12} \frac{1}{6} \beta_x \right), \quad (4.31)$$

$$F_2 = \frac{1}{6\pi c^{\frac{3}{2}}(1-v^2)} \left( \gamma_{21} \frac{a}{h} u + \gamma_{22} \frac{1}{6} \beta_x \right), \quad (4.32)$$

$$F_3 = \frac{16}{15\pi\sqrt{c}(1-v^2)} \gamma_{33} \frac{a}{h} \omega, \quad (4.33)$$

$$F_4 = \frac{\sqrt{c}}{\pi(1-v^2)} \left( \gamma_{44} \frac{a}{h} v + \gamma_{45} \frac{1}{6} \beta_y \right), \quad (4.34)$$

$$F_5 = \frac{\sqrt{c}}{6\pi(1-v^2)} \left( \gamma_{54} \frac{a}{h} v + \gamma_{55} \frac{1}{6} \beta_y \right) \quad (4.35)$$

where

$$\begin{aligned} \gamma_{11} &= \frac{\alpha_{22}}{\Delta_1}, \quad \gamma_{12} = \gamma_{21} = -\frac{\alpha_{12}}{\Delta_1}, \quad \gamma_{22} = \frac{\alpha_{11}}{\Delta_1}, \quad \gamma_{33} = -\frac{1}{\alpha_{33}}, \quad \gamma_{44} = \frac{\alpha_{55}}{\Delta_2}, \\ \gamma_{45} = \gamma_{54} &= -\frac{\alpha_{45}}{\Delta_2}, \quad \gamma_{55} = \frac{\alpha_{44}}{\Delta_2}, \quad \Delta_1 = \alpha_{11}\alpha_{22} - \alpha_{12}^2, \quad \Delta_2 = \alpha_{44}\alpha_{55} - \alpha_{45}^2 \end{aligned} \quad (4.36)$$

If the crack opening displacements and the rotations are expressed in terms of  $G_j$  ( $j=1, \dots, 5$ ) and using (4.31)-(4.35), the final form of the system of integral equations are obtained as

$$\begin{aligned} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_1(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{1j}(y,t) G_j(t) dt + \frac{4}{c^{\frac{3}{2}}(1-v^2)} \left[ \gamma_{11} \frac{a}{h} \int_{-\sqrt{c}}^y G_1(t) dt + \right. \\ \left. \gamma_{12} \frac{1}{6} \int_{-\sqrt{c}}^y G_2(t) dt \right] = 4\pi F_{10}(y), \quad -\sqrt{c} < y < \sqrt{c} \end{aligned} \quad (4.37)$$

$$\begin{aligned} \frac{(1-v^2)}{\lambda^4} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_2(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{2j}(y,t) G_j(t) dt + \frac{2}{3c^{\frac{3}{2}}(1-v^2)} \left[ \gamma_{21} \frac{a}{h} \int_{-\sqrt{c}}^y G_1(t) dt + \right. \\ \left. \gamma_{22} \frac{1}{6} \frac{h}{a} \int_{-\sqrt{c}}^y G_2(t) dt \right] = 4\pi \frac{h}{a} F_{20}(y), \quad -\sqrt{c} < y < \sqrt{c} \end{aligned} \quad (4.38)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_3(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{3j}(y,t) G_j(t) dt + \frac{10}{27\sqrt{c}(1-\nu)} \left[ \gamma_{33} \frac{a}{h} \int_{-\sqrt{c}}^y G_3(t) dt \right] = 2\pi F_{30}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (4.39)$$

$$\int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_4(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{4j}(y,t) G_j(t) dt + \frac{4\sqrt{c}}{(1-\nu^2)} \left[ \gamma_{44} \frac{a}{h} \int_{-\sqrt{c}}^y G_4(t) dt + \gamma_{44} \frac{a}{h} \int_{-\sqrt{c}}^y \left( \frac{\lambda_2}{\lambda} \right)^2 t G_3(t) dt + \gamma_{45} \frac{1}{6} \int_{-\sqrt{c}}^y G_5(t) dt \right] = 4\pi F_{40}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (4.40)$$

$$\frac{(1-\nu^2)}{\lambda^4} \int_{-\sqrt{c}}^{+\sqrt{c}} \frac{G_5(t)}{t-y} dt + \sum_{j=1}^5 \int_{-\sqrt{c}}^{+\sqrt{c}} k_{5j}(y,t) G_j(t) dt + \frac{2\sqrt{c}}{3(1-\nu^2)} \left[ \gamma_{54} \int_{-\sqrt{c}}^y G_4(t) dt + \gamma_{54} \int_{-\sqrt{c}}^y \left( \frac{\lambda_2}{\lambda} \right)^2 t G_3(t) dt + \gamma_{55} \frac{1}{6} \int_{-\sqrt{c}}^y G_5(t) dt \right] = 4\pi \frac{h}{a} F_{50}(y), \quad -\sqrt{c} < y < \sqrt{c} \quad (4.41)$$

where the Fredholm kernels  $k_{ij}$  ( $i,j=1,\dots,5$ ) are given in Appendix C.

After normalizing the interval  $(-\sqrt{c}, \sqrt{c})$  and by using the numerical solution method given in Section 3.2, the singular integral equation (4.37) through (4.41) are solved for  $G_j$  ( $j=1,\dots,5$ ). Then the crack surface displacements and rotations are evaluated as follows:

$$\begin{aligned} u(+0, y) &= \int_{-\sqrt{c}}^y G_1(t) dt, \\ \beta_x(+0, y) &= \int_{-\sqrt{c}}^y G_2(t) dt, \\ w(+0, y) &= \int_{-\sqrt{c}}^y G_3(t) dt, \\ v(+0, y) &= \int_{-\sqrt{c}}^y \left[ G_4(t) + \left( \frac{\lambda_2}{\lambda} \right)^2 t G_3(t) \right] dt, \\ \beta_y(+0, y) &= \int_{-\sqrt{c}}^y G_5(t) dt \end{aligned} \quad (4.42)$$

By using (4.16), (4.1) and (4.31)-(4.35),  $\sigma_j$  ( $j=1,\dots,5$ ) can be written as

$$\begin{aligned}
 \sigma_1 &= \frac{E}{\pi\sqrt{c(1-\nu^2)}} \left( \gamma_{11} \frac{a}{h} u + \gamma_{12} \frac{1}{6} \beta_x \right), \\
 \sigma_2 &= \frac{E}{\pi\sqrt{c(1-\nu^2)}} \left( \gamma_{21} \frac{a}{h} u + \gamma_{22} \frac{1}{6} \beta_x \right), \\
 \sigma_3 &= \frac{2E}{3\pi(1-\nu^2)} \gamma_{33} \frac{a}{h} w, \\
 \sigma_4 &= \frac{\sqrt{c}E}{\pi(1-\nu^2)} \left( \gamma_{44} \frac{a}{h} v + \gamma_{45} \frac{1}{6} \beta_y \right), \\
 \sigma_5 &= \frac{\sqrt{c}E}{\pi(1-\nu^2)} \left( \gamma_{54} \frac{a}{h} v + \gamma_{55} \frac{1}{6} \beta_y \right)
 \end{aligned} \tag{4.43}$$

The stress intensity factors  $k_1$ ,  $k_2$  and  $k_3$  may then be obtained by substituting from (4.42) and (4.43) into (4.17)-(4.19).

In the solution of singular integral equations (4.37)-(4.41), the input functions  $F_{j0}$  ( $j=1,\dots,5$ ) are the same ones given in (3.4.19). Even though  $l(X_2) = l(ay/\sqrt{c})$  describing the crack shape can be any single-valued function, the problem is solved only for a semi-elliptic surface crack given by

$$l(X_2) = l_0 \sqrt{1 - X_2^2 c / a^2}, \quad -a < X_2 < a \tag{4.44}$$

The normalizing stress intensity factors are obtained from the solution of the corresponding edge cracked strip shown in Figure 4. Under the same specified perturbation load as for the shell. The normalizing stress intensity factor  $k_{1m}$ ,  $k_{1b}$ ,  $k_{2v}$ ,  $k_{3s}$  and  $k_{3r}$  are corresponding value for the plane strain problem, under membrane loading  $N_{11}^\infty$ , bending moment  $M_{11}^\infty$ , out-of plane shear  $V_1^\infty$ , in-plane shear  $N_{12}^\infty$  and twisting moment  $M_{12}^\infty$ , respectively, are defined as follows

$$\begin{aligned}
k_{1m} &= \sigma_1^\infty \sqrt{hp_1(\xi_0)} , \\
k_{1b} &= \sigma_2^\infty \sqrt{hp_2(\xi_0)} , \\
k_{2b} &= \sigma_3^\infty \sqrt{hp_3(\xi_0)} , \\
k_{3s} &= \sigma_4^\infty \sqrt{hp_4(\xi_0)} , \\
k_{3t} &= \sigma_5^\infty \sqrt{hp_5(\xi_0)} , \quad \xi_0 = l_0/h
\end{aligned} \tag{4.45}$$

where  $\sigma_i^\infty$  ( $i=1,\dots,5$ ) are the stress resultants as given in Appendix A.

The normalized stress intensity factors are calculated at the maximum penetration point of a semi-elliptic inner or outer surface crack in the shell for various combination of  $R/h$ ,  $a/h$ ,  $l_0/h$  and  $l/a$  which are the characteristic dimensionless length parameters of the shell. In all calculations given in this part, it is assumed that the Poisson's ratio  $\nu$  is 0.3 and the material is isotropic. In addition to this, the effect of material orthotropy and Poisson's ratio on the normalized stress intensity factors is investigated.

Results are presented to emphasize the effect of crack length ( $a/h$ ), crack depth ( $l_0/h$ ) and shell curvature ( $R/h$ ) on the stress intensity factor. Variation of the stress intensity factors is plotted against distance from the fixed end ( $l/a$ ). First the stress intensity factors for different crack depths ( $l_0/h$ ) at fixed crack length ( $a/h=1$ ) and shell curvature ( $R/h=5$ ) are plotted in Figures 14 through 19. In Figures 20 through 24, variation of the stress intensity factors with crack length ( $a/h$ ) for fixed crack depth ( $l_0/h=0.2$ ) and shell curvature ( $R/h=5$ ) are plotted.

As  $l/a \rightarrow \infty$ , the normalized stress intensity factors are in excellent agreement with the results given for infinite cylinder in [19], [20]. The results given in Tables 16 through 55, it is clear that the part-through crack results are not very sensitive to shell curvature. Consequently, the difference between the stress intensity factors for the crack located inner and outside the shell is not significant.

Figure 4. Development of the Line-Spring Model for a Part-Through Crack

Tables 16 through 23 show some sample results for a cylindrical shell subjected to uniform membrane loading,  $N_{11}^{\infty}$  away from the crack region. The value of normalized stress intensity factor  $k_1/k_{1m}$  increases with increasing  $R/h$  and decreasing  $a/h$  ratios for all crack depths. As seen in this figure, for  $l_0/h=0.2$  and  $R/h=5$  at small  $a/h$  values, while crack approaches to the fixed end, an increase in the normalized stress intensity factor can be observed.

If the uniform bending moment  $M_{11}^{\infty}$  is applied to the shell away from the crack region, the normalized stress intensity factor  $k_1/k_{1b}$  increases with increasing  $R/h$  and decreasing  $a/h$  ratios for all  $l_0/h$  values as seen in Tables 24 through 31. As in the case of uniform membrane loading, when crack approaches to the fixed end there seems an increase in the normalized stress intensity factor for small  $a/h$  values, and  $R/h=5$  and  $l_0/h=0.2$ .

In Tables 27 through 31, for small crack length,  $a/h=1$ , the normalized stress intensity factor  $k_1/k_{1b}$  changes sign as crack gets deeper. Needless to say, when the stress intensity factor becomes negative, the problem is no longer a simple crack problem and must be treated as a crack-contact problem. In such a case the solution given in this thesis is, of course, not valid. The crack contact problem is highly nonlinear in which the additional unknown function  $l(y)$  has to be determined by using the following condition

$$k_1 = \sqrt{h} [\sigma_1 p_1(\xi) + \sigma_2 p_2(\xi)] = 0 \quad (4.46)$$

Even though the problem can be solved by a complicated iterative scheme, quite clearly it has no practical value. From a viewpoint of structural failure, the important problems in practice are those of crack opening not crack closing.

Unlike the mode I problem, the three-dimensional modes II and III crack problems are always coupled. For example, in a plate containing a surface crack of finite length  $2a$  and a constant depth  $l_0$  and subjected to in-plane shear loading  $N_{12}^{\infty}$ , even though the primary mode of deformation along the crack front  $X_3=\text{constant}$  is mode III and  $X_2=\text{constant}$  mode II,  $X_2 X_3$  being the plane of the crack, the stress intensity factors corresponding to the secondary modes ( $k_2$  along  $X_3=\text{constant}$   $k_3$  and along  $X_2=\text{constant}$ ) are not zero. Similarly, for a semi-elliptic surface crack the primary stress intensity factor would be  $k_3$  in the central portion of the crack and  $k_2$

near the ends. It is in the nature of the line-spring model that the "stress intensity factors"  $k_2$  and  $k_3$  are introduced into the model in the  $X_2 X_3$ -plane,  $X_1$  being the coordinate perpendicular to the plane of the crack. On the other hand, the conventional definition of the stress intensity factors refers to the local coordinate system  $X'_1, X'_2, X'_3$  at the crack front with  $X'_1=X_1$  and  $X'_2$  and  $X'_3$  being, respectively, tangent and normal to the crack front. Thus, the physically relevant stress intensity factors  $k'_1, k'_2,$  and  $k'_3$  may be expressed in terms of  $k_1, k_2$  and  $k_3$  given by line-spring model

$$\begin{aligned} k'_1 &= k_1 \\ k'_2 &= k_2 \cos \theta - k_3 \sin \theta \\ k'_3 &= k_2 \sin \theta + k_3 \cos \theta \end{aligned} \quad (4.47)$$

where  $\theta$  is the angle between  $X_3$ , the normal to the shell and  $X'_3$  the normal to the crack front. Since the line-spring model is most accurate in the center of the crack, the normalized stress intensity factors are calculated for the deepest penetration point of the crack (i.e.  $\theta=0^\circ$ )

Tables 32 through 39 show some example results for a cylindrical shell subjected to vertical shear loading  $V_1^\infty$ . The normalized stress intensity factor for the vertical shear are nearly insensitive to  $R/h$  and  $a/h$  ratios. As crack approaches to the fixed end, the normalized stress intensity factor  $k_2/k_{2v}$ , first increases and then decreases slightly for all  $a/h$  ratios at  $l_0/h=0.2$  and  $R/h=5$  as seen in Figure 22.

If the shell under the effect of in-plane shear  $N_{12}^\infty$ , the normalized stress intensity factor  $k_3/k_{3s}$ , increases with increasing  $R/h$  and  $a/h$  ratios for all crack depth values as given in Tables 40 through 47. As crack approaches to the fixed end, a small decrease in the normalized stress intensity factor is observed for different  $a/h$  values for  $l_0/h=0.2$  and  $R/h=5$  in Figure 23.

Tables 48 through 55 show the effect of loading of twisting moment on the normalized stress intensity factor. The normalized stress intensity factor  $k_3/k_{3t}$ , decreases, as crack approaches to the fixed end for all  $a/h$  ratios at  $l_0/h=0.2$  and  $R/h=5$ .

Some physical explanation of sign reversal in mode III stress intensity factor  $k_3$  in the cylindrical shell with relatively deep surface cracks under twisting moment is needed (Tables 48 through 55 and Figure 19). Theoretically the problem is a three-dimensional part-through crack problem in which the crack surface traction

$$\sigma_{12}(0, X_2, X_3) = \frac{6M_{12}}{h^2} \frac{X_3}{(h/2)}, \quad |X_2| < a$$

$$[(h/2) - l] < X_3 < (h/2) \quad (4.48)$$

is the only external load. Thus in shallow crack the negative shear tractions for  $X_3 > 0$  would dominate giving  $k_3(0) > 0$ . Also, since part of the effect of the shear tractions  $\sigma_{12}$  is balanced by the uncracked portion of the shell  $\{X_1 = 0, |X_2| > 0, [(h/2) - l] < X_3 < (h/2)\}$ ,  $k_3(0)$  would be less than  $k_3$ , which is obtained from the anti-plane shear solution with  $a \rightarrow \infty$ . However, for very deep cracks,  $l > (h/2)$ , the shear traction  $\sigma_{12}$  for  $X_3 > 0$  would be balanced by the uncracked part of the shell,  $|X_2| > a$  to a much greater extent than for  $X_3 < 0$  and consequently the influence of the tractions  $\sigma_{12}(0, X_2, X_3)$  for  $X_3 < 0$  on the deformation behavior along the crack front near  $X_2 = 0$  would be more dominant. Since  $\sigma_{12} > 0$  for  $X_3 < 0$ , the resulting mode III stress intensity factor would become negative.

For the five possible loading conditions, the influence of Poisson's ratio on the normalized stress intensity factors is given for a geometry of  $a/h=1$  and  $R/h=5$  in Table 56. As in the case of through crack, the effect of  $\nu$  (varying between 0. and 0.5) on the normalized stress intensity factors is found to be insignificant.

The effect of material orthotropy on the normalized stress intensity factors in a cylindrical shell under five possible loading is given in Table 57. The table shows that the deviation from isotropic results can be considerable.

## CHAPTER V

### CONCLUSION

In this study, the effect of fixed end on stress intensity factors for a cylindrical shell containing a circumferential through and part-through crack are determined. In the formulation of the problem, the line-spring model is used. The problem is reduced to five simultaneous singular integral equations, and then solved numerically by using Gauss-Chebyshev integration formulas. Normalized stress intensity factors are obtained for five different loading conditions, The results of this work can be summarized as follows ;

- In the through crack problem, under each loading condition (except transverse loading) only one of the stress intensity factors is important, the others are relatively insignificant.
- As crack approaches to the fixed end, considerable increase in the stress intensity factors  $k_{mm}$  can be observed for all  $a/h$  ratios. Effect of fixed end on the stress intensity factor  $k_{bb}$  is significant for small  $a/h$  ratios and relatively small as crack length decreases. Influence of the fixed end on the stress intensity factors  $k_{ss}$ ,  $k_{vv}$  and  $k_{tt}$  is relatively small.
- The stress intensity factors  $k_{mm}$  and  $k_{ss}$  increase and  $k_{bb}$  decrease with an increase in the  $h/R$  and/or  $a/h$  ratios. The stress intensity factor  $k_{vv}$  decreases with an increase in the  $h/R$  ratio regardless of distance from the fixed end. The stress intensity factor  $k_{tt}$  is nearly independent of the orientation of the crack and  $h/R$  ratio.
- Whereas, in the part through crack problem, the influence of fixed end on mode I stress intensity factors  $k_1 / k_{1m}$  and  $k_1 / k_{1b}$  is significant, while mode II and III stress intensity factors  $k_2 / k_{2v}$ ,  $k_3 / k_{3s}$  and  $k_3 / k_{3t}$  have nearly the same stress intensity factor values as infinitely long cylinders. Therefore, it can be concluded

that the influence of fixed end on Mode II and mode III stress intensity factors is negligible.

- Stress intensity factor for part-through crack are not very sensitive to shell curvature. Consequently, the difference in the stress intensity factors for the crack located inside and outside of the shell are not significant.
- The line-spring model used in the formulation of part-through problem is based on two assumptions. The first involves replacing the net ligament by resultant forces which are functions of  $X_2$  only. The second assumption is that the stress intensity factors along the crack front may be obtained from these resultant forces as though the stress state were one of plane strain. The restriction at the ends of the crack and the crack front curvature, both against this assumption. Since the model is most accurate at the center of the crack, results obtained are best applied to the problems where failure occurs when the surface crack grows through the thickness leading either to leaking or to the development of a through crack which then grows in length to critical size.
- It is shown that the orthotropy of the material has a significant effect on the stress intensity factors.
- The effect of Poisson's ratio on the stress intensity factors does not seem to be very significant.
- It should be emphasized that all solutions presented in this study correspond to the perturbation problem, where constant loading along the length of the crack has been assumed. To make use of the results, the solution to the uncracked shell must first be obtained along the plane of the crack, Then superposition principles apply.
- For the problem of crack touching the fixed end, it is not possible to obtain a solution by current method, because of the change in boundary conditions on crack surfaces. This is a different problem by itself.
- For a future study, the problem of arbitrarily oriented crack with a fixed end can be solved for five possible loadings, which is the general case.

## APPENDIX B

### ASYMPTOTIC VALUES OF KERNELS OF INTEGRAL EQUATIONS

In this part, asymptotic values of kernels of integral equations (3.1.93)-(3.1.97) for  $\alpha \rightarrow \infty$  will be given.

Denote the inregrands of the infinite integrals of the integral equations (3.1.93)-(3.1.97) as

$$K_{un,1} = \alpha^2 \sum_{j=1}^8 K_j R_j \quad (B.1)$$

$$K_{un,2} = \frac{1}{\lambda^4} \left[ \sum_{j=1}^8 \frac{p_j + (1-\nu)\alpha^2}{\kappa p_j - 1} R_j - \frac{\kappa(1-\nu)^2}{2} i\alpha (A_1 r_1 + A_2 r_2) \right] \quad (B.2)$$

$$K_{un,3} = \sum_{j=1}^8 \frac{\kappa p_j m_j R_j}{\kappa p_j - 1} - \frac{\kappa(1-\nu)}{2} \alpha i (A_1 + A_2) \quad (B.3)$$

$$K_{un,4} = i\alpha \sum_{j=1}^8 K_j m_j R_j \quad (B.4)$$

$$K_{un,5} = \frac{(1-\nu)}{\lambda^4} \left[ i\alpha \sum_{j=1}^8 \frac{m_j R_j}{\kappa p_j - 1} + \frac{\kappa(1-\nu)}{4} (\alpha^2 + r_1^2) (A_1 + A_2) \right] \quad (B.5)$$

Let the asymptotic values of  $K_{un,i}$  ( $i=1, \dots, 5$ ) for  $\alpha \rightarrow \infty$  be  $K_{as,i}$  ( $i=1, \dots, 5$ ), respectively. To be able to evaluate  $K_{as,i}$  ( $i=1, \dots, 5$ ), define the following new auxiliary expressions in terms of  $B_0, B_1, \dots, B_8$  as follows

$$\begin{aligned}
\sum_{j=1}^4 \frac{m_j R_j}{p_j^4} - \sum_{j=5}^8 \frac{m_j R_j}{p_j^4} &= B_0 \\
\sum_{j=1}^4 \frac{m_j R_j}{p_j^3} - \sum_{j=5}^8 \frac{m_j R_j}{p_j^3} &= B_1 \\
&\vdots \\
\sum_{j=1}^4 m_j p_j^4 R_j - \sum_{j=5}^8 m_j p_j^4 R_j &= B_8
\end{aligned} \tag{B.6}$$

From equations (3.1.99) and (3.1.100), it is known that

$$\begin{aligned}
m_j \Big|_{\alpha \rightarrow \infty} &= -|\alpha| \left( 1 + \frac{a_1 p_j}{\alpha^2} - \frac{a_2 p_j^2}{\alpha^4} + \dots + \frac{a_n p_j^n}{\alpha^{2n}} \right) \quad j=1,2,3,4 \\
m_j \Big|_{\alpha \rightarrow \infty} &= |\alpha| \left( 1 + \frac{a_1 p_j}{\alpha^2} - \frac{a_2 p_j^2}{\alpha^4} + \dots + \frac{a_n p_j^n}{\alpha^{2n}} \right) \quad j=5,6,7,8
\end{aligned} \tag{B.7}$$

If one now substitutes the asymptotic values of  $m_j(\alpha)$  given in (B.7) into (B.6) and solves for,  $\sum_1^8 \frac{R_j}{p_j^4}$ ,  $\sum_1^8 \frac{R_j}{p_j^3}$ , .....,  $\sum_1^8 R_j p_j^4$ , the following expressions can be found

$$\sum_{j=1}^8 p_j^4 R_j(\alpha) = -\frac{B_8}{\alpha}$$

$$\sum_{j=1}^8 p_j^3 R_j(\alpha) = -\frac{B_7}{\alpha} + \frac{B_8}{2\alpha^3}$$

$$\sum_{j=1}^8 p_j^2 R_j(\alpha) = -\frac{B_6}{\alpha} + \frac{B_7}{2\alpha^3} - \frac{3B_8}{8\alpha^5}$$

$$\sum_{j=1}^8 p_j R_j(\alpha) = -\frac{B_5}{\alpha} + \frac{B_6}{2\alpha^3} - \frac{3B_7}{8\alpha^5} + \frac{5B_8}{16\alpha^7}$$

$$\sum_{j=1}^8 R_j(\alpha) = -\frac{B_4}{\alpha} + \frac{B_5}{2\alpha^3} - \frac{3B_6}{8\alpha^5} + \frac{5B_7}{16\alpha^7} - \frac{15B_8}{64\alpha^9}$$

$$\sum_{j=1}^8 \frac{R_j(\alpha)}{p_j} = -\frac{B_3}{\alpha} + \frac{B_4}{2\alpha^3} - \frac{3B_5}{8\alpha^5} + \frac{5B_6}{16\alpha^7} - \frac{15B_7}{64\alpha^9} + \frac{23B_8}{128\alpha^{11}}$$

$$\sum_{j=1}^8 \frac{R_j(\alpha)}{p_j^2} = -\frac{B_2}{\alpha} + \frac{B_3}{2\alpha^3} - \frac{3B_4}{8\alpha^5} + \frac{5B_5}{16\alpha^7} - \frac{15B_6}{64\alpha^9} + \frac{23B_7}{128\alpha^{11}}$$

$$\sum_{j=1}^8 \frac{R_j(\alpha)}{p_j^3} = -\frac{B_1}{\alpha} + \frac{B_2}{2\alpha^3} - \frac{3B_3}{8\alpha^5} + \frac{5B_4}{16\alpha^7} - \frac{15B_5}{64\alpha^9} + \frac{23B_6}{128\alpha^{11}}$$

$$\sum_{j=1}^8 \frac{R_j(\alpha)}{p_j^4} = -\frac{B_0}{\alpha} + \frac{B_1}{2\alpha^3} - \frac{3B_2}{8\alpha^5} + \frac{5B_3}{16\alpha^7} - \frac{15B_4}{64\alpha^9} + \frac{23B_5}{128\alpha^{11}} \quad (\text{B.8})$$

Thus the problem is reduced to the evaluation of  $B_0, B_1, \dots, B_8$ . From equation (3.1.79), it is seen that

$$B_4 = \sum_{j=1}^4 m_j R_j(\alpha) - \sum_{j=5}^8 m_j R_j(\alpha) = -\frac{iq_2}{\alpha} \quad (\text{B.9})$$

recalling (3.1.18)

$$K_j = \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{(p_j + \alpha^2)}{p_j^2} \quad (\text{B.10})$$

and using (3.1.78),  $B_2$  and  $B_3$  can be found as

$$B_2 = -\left( \frac{\lambda}{\lambda_2} \right)^2 \frac{iq_1}{\alpha^3}$$

$$B_3 = \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{iq_1}{\alpha^3} \quad (\text{B.11})$$

In a similar way, using (3.1.68)-(3.1.72) and (3.1.78), (3.1.79),  $B_0$ ,  $B_1$  can be obtained as

$$B_0 = \frac{\kappa(1-\nu)iq_2}{\lambda_2^4 \alpha^3} - \frac{(1-2\nu)iq_2}{\lambda_2^4 \alpha^5} - \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{iq_1}{\alpha^7}$$

$$B_1 = \frac{(1-\nu)iq_2}{\lambda_2^4 \alpha^3} + \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{iq_1}{\alpha^5} \quad (\text{B.12})$$

Also, observing that

$$\kappa \left( \sum_{j=1}^4 \frac{p_j^{n-3} m_j R_j(\alpha)}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{p_j^{n-3} m_j R_j(\alpha)}{\kappa p_j - 1} \right) = \left( \sum_{j=1}^4 p_j^{n-4} m_j R_j - \sum_{j=5}^8 p_j^{n-4} m_j R_j \right) +$$

$$\left( \sum_{j=1}^4 \frac{p_j^{n-4} m_j R_j(\alpha)}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{p_j^{n-4} m_j R_j(\alpha)}{\kappa p_j - 1} \right), \quad n = 0, 1, \dots, 8 \quad (\text{B.13})$$

and referring to (B.6),  $B_n$  can also be expressed as,

$$B_n = \kappa \left( \sum_{j=1}^4 \frac{p_j^{n-3} m_j R_j}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{p_j^{n-3} m_j R_j}{\kappa p_j - 1} \right) - \left( \sum_{j=1}^4 \frac{p_j^{n-4} m_j R_j}{\kappa p_j - 1} - \sum_{j=5}^8 \frac{p_j^{n-4} m_j R_j}{\kappa p_j - 1} \right) \quad (\text{B.14})$$

By substituting the expression of  $p_j$  given in (3.1.20) into (3.1.9), it can be shown that

$$\frac{1}{\kappa p_j - 1} = \frac{\lambda_2^4 m_j^4}{p_j^4} \quad (\text{B.15})$$

Using (B.15), (B.14), (B.11) and (B.12), remaining  $B_j$  terms can be found as,

$$\begin{aligned}
B_5 &= -(1-\nu)\alpha(iq_2) + \kappa\lambda_2^4 \frac{(iq_2)}{\alpha} + \kappa\lambda_2^2\lambda^2\alpha(iq_1) \\
B_6 &= -\kappa\lambda_2^4(3-\nu)\alpha(iq_2) + \kappa\lambda_2^2\lambda^2\alpha^3(iq_1) + \lambda_2^2\lambda^2(\kappa\lambda_2^4 - 1)\alpha(iq_1) \\
B_7 &= -\kappa\lambda_2^4(3-2\nu)\alpha^3(iq_2) + (3\kappa\lambda_2^4 - 1)\lambda_2^2\lambda^2\alpha^3(iq_1) + \mathcal{O}(\alpha^1) \\
B_8 &= -(1-\nu)\kappa\lambda_2^4\alpha^5(iq_2) + 3\kappa\lambda_2^6\lambda^2\alpha^5(iq_1) + \mathcal{O}(\alpha^3) \tag{B.16}
\end{aligned}$$

By substituting (B.11), (B.12) and (B.16) into (B.8), one can obtain following results,

$$\sum_{j=1}^8 \frac{R_j}{P_j^4} = \text{sign}(\alpha) \left[ -\frac{\kappa(1-\nu)}{\lambda_2^4} \frac{(iq_2)}{\alpha^4} + \frac{(3-5\nu)}{2\lambda_2^4} \frac{(iq_2)}{\alpha^6} + \frac{35}{16} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{(iq_1)}{\alpha^8} + \mathcal{O}(\alpha^{-10}) \right]$$

$$\begin{aligned}
\sum_{j=1}^8 \frac{R_j}{P_j^3} &= \text{sign}(\alpha) \left[ -\frac{(1-\nu)}{\lambda_2^4} \frac{(iq_2)}{\alpha^4} - \frac{5(1+3\nu)}{64} \frac{(iq_2)}{\alpha^8} - \right. \\
&\quad \left. \frac{15}{8} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{(iq_1)}{\alpha^6} - \frac{15}{64} \kappa\lambda_2^2\lambda^2 \frac{(iq_1)}{\alpha^8} + \mathcal{O}(\alpha^{-10}) \right]
\end{aligned}$$

$$\sum_{j=1}^8 \frac{R_j}{P_j^2} = \text{sign}(\alpha) \left[ \frac{(1+5\nu)}{16} \frac{(iq_2)}{\alpha^6} + \frac{3}{2} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{(iq_1)}{\alpha^4} + \frac{5}{64} \kappa\lambda_2^2\lambda^2 \frac{(iq_1)}{\alpha^6} + \mathcal{O}(\alpha^{-8}) \right]$$

$$\begin{aligned}
\sum_{j=1}^8 \frac{R_j}{P_j} &= \text{sign}(\alpha) \left[ -\frac{(1+3\nu)}{8} \frac{(iq_2)}{\alpha^4} + \frac{3}{8} \kappa\lambda_2^4 \frac{(iq_2)}{\alpha^6} - \right. \\
&\quad \left. \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{(iq_1)}{\alpha^2} - \frac{1}{16} \kappa\lambda_2^2\lambda^2 \frac{(iq_1)}{\alpha^4} + \mathcal{O}(\alpha^{-6}) \right]
\end{aligned}$$

$$\sum_{j=1}^8 R_j = \text{sign}(\alpha) \left[ \frac{(1+\nu)(iq_2)}{2\alpha^2} + \frac{\kappa\lambda_2^2\lambda^2(iq_1)}{8\alpha^2} + \mathcal{O}(\alpha^{-4}) \right]$$

$$\sum_{j=1}^8 p_j R_j = \text{sign}(\alpha) \left[ (1-\nu)(iq_2) - \frac{\kappa\lambda_2^2\lambda^2}{2}(iq_1) + \mathcal{O}(\alpha^{-2}) \right]$$

$$\sum_{j=1}^8 p_j^2 R_j = \text{sign}(\alpha) \left[ -\kappa\lambda_2^2\lambda^2\alpha^2(iq_1) + \mathcal{O}(\alpha^0) \right]$$

$$\sum_{j=1}^8 p_j^3 R_j = \mathcal{O}(\alpha^2)$$

$$\sum_{j=1}^8 p_j^4 R_j = \mathcal{O}(\alpha^4) \quad (\text{B.17})$$

Similarly, the asymptotic analysis of the terms  $\sum_1^8 p_j^{-4} m_j R_j$ ,  $\sum_1^8 p_j^{-3} m_j R_j$ , .....  
 $\sum_1^8 p_j^4 m_j R_j$  as  $\alpha \rightarrow \infty$  have to be evaluated. By denoting

$$\sum_{j=1}^4 \frac{R_j}{p_j^4} - \sum_{j=5}^8 \frac{R_j}{p_j^4} = C_0 \quad ,$$

$$\sum_{j=1}^4 \frac{R_j}{p_j^3} - \sum_{j=5}^8 \frac{R_j}{p_j^3} = C_1 \quad ,$$

⋮

$$\sum_{j=1}^4 p_j^4 R_j - \sum_{j=5}^8 p_j^4 R_j = C_8 \quad (\text{B.18})$$

also by substituting the expansions for  $m_j$  given in (3.1.99) and (3.1.100), asymptotic values of terms  $\sum_1^8 p_j^{-4} m_j R_j$ ,  $\sum_1^8 p_j^{-3} m_j R_j$ , .....  
 $\sum_1^8 p_j^4 m_j R_j$  as  $\alpha \rightarrow \infty$  can be expressed in terms of auxiliary expressions  $C_0, C_1, \dots, C_8$  as follows,

$$\begin{aligned} \sum_1^8 \frac{m_j R_j}{p_j^4} &= -|\alpha| \left( C_0 + \frac{1}{2\alpha^2} C_1 - \frac{1}{8\alpha^4} C_2 + \dots \right) \\ \sum_1^8 \frac{m_j R_j}{p_j^3} &= -|\alpha| \left( C_1 + \frac{1}{2\alpha^2} C_2 - \frac{1}{8\alpha^4} C_3 + \dots \right) \\ \sum_1^8 \frac{m_j R_j}{p_j^2} &= -|\alpha| \left( C_2 + \frac{1}{2\alpha^2} C_3 - \frac{1}{8\alpha^4} C_4 + \dots \right) \\ \sum_1^8 \frac{m_j R_j}{p_j} &= -|\alpha| \left( C_3 + \frac{1}{2\alpha^2} C_4 - \frac{1}{8\alpha^4} C_5 + \dots \right) \\ \sum_1^8 m_j R_j &= -|\alpha| \left( C_4 + \frac{1}{2\alpha^2} C_5 - \frac{1}{8\alpha^4} C_6 + \dots \right) \\ \sum_1^8 P_j m_j R_j &= -|\alpha| \left( C_5 + \frac{1}{2\alpha^2} C_6 - \frac{1}{8\alpha^4} C_7 + \dots \right) \end{aligned} \quad (\text{B.19})$$

So, it is required to evaluate  $C_0, C_1, \dots, C_8$ . By using (3.1.80)-(3.1.82) and boundary conditions (3.1.68)-(3.1.72), following expressions can be found as

$$C_1 = -\frac{iq_3}{\alpha^7} + \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^6} + \frac{(1-\nu) q_5}{\lambda_2^4 \alpha^4}$$

$$C_2 = \frac{iq_3}{\alpha^5} - \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^4}$$

$$C_3 = -\frac{iq_3}{\alpha^3} + \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^2}$$

$$C_4 = \frac{iq_3}{\alpha} \quad (\text{B.20})$$

The remaining  $C_j$  terms can be obtained by using the following identity

$$C_n = \kappa \left( \sum_1^4 \frac{p_j^{n-3} R_j}{\kappa p_j - 1} - \sum_5^8 \frac{p_j^{n-3} R_j}{\kappa p_j - 1} \right) - \left( \sum_1^4 \frac{p_j^{n-4} R_j}{\kappa p_j - 1} - \sum_5^8 \frac{p_j^{n-4} R_j}{\kappa p_j - 1} \right) \quad (\text{B.21})$$

and equation (B.15) as follows

$$C_0 = -\frac{1}{\lambda_2^4} \frac{iq_3}{\alpha^5} + \frac{iq_3}{\alpha^9} - \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^8} + \frac{\kappa(1-\nu)}{\lambda_2^2} \frac{q_5}{\alpha^4} - \frac{2(1-\nu)}{\lambda_2^4} \frac{q_5}{\alpha^6}$$

$$C_5 = d_1 q_3 - (1-\nu) q_5$$

$$C_6 = d_2 \alpha (iq_3) + d_1 \alpha^2 q_4 + (d_1 d_2 - \lambda_2^2 \lambda^2) q_4 - d_2 (1-\nu) q_5$$

$$C_7 = d_2 \alpha^3 (iq_3) + (d_2^2 - \lambda_2^4) (iq_3) + (3d_1 d_2 - \lambda_2^2 \lambda^2) \alpha^2 q_4 \\ + (d_1 d_2^2 - 2d_1 \lambda_2^4) q_4 - 2(1-\nu) d_2 \alpha^2 q_5 + (1-\nu) (\lambda_2^4 - d_2^2) q_5$$

$$C_8 = (3d_2^2 - \lambda_2^4) \alpha^3 (iq_3) + (d_2^2 - d_2 \lambda_2^4) \alpha (iq_3) + 3d_1 d_2 \alpha^4 q_4 \\ (2d_2^2 - 4\lambda_2^4 - 2) d_1 \alpha^2 q_4 - (1-\nu) d_2 \alpha^4 q_5 \\ + (1-\nu) (2\lambda_2^4 - 4d_2^2) \alpha^2 q_5 + \mathcal{O}(\alpha^0) \quad (\text{B.22})$$

where

$$d_1 = \kappa \lambda_2^2 \lambda^2 \\ d_2 = \kappa \lambda_2^4 \quad (\text{B.23})$$

Substituting (B.20) and (B.22) into (B.19), following expressions can be obtained

$$\sum_1^8 \frac{m_j R_j}{p_j^4} = -\alpha \operatorname{sign}(\alpha) \left[ -\frac{1}{\lambda_2^4} \frac{i q_3}{\alpha^5} + \frac{35}{128} \frac{i q_3}{\alpha^9} - \frac{5}{16} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^8} \right. \\ \left. + \frac{\kappa(1-\nu)}{\lambda_2^4} \frac{q_5}{\alpha^4} - \frac{3(1-\nu)}{2} \frac{q_5}{\lambda_2^4} \frac{q_5}{\alpha^6} + \mathcal{O}(\alpha^{-10}) \right]$$

$$\sum_1^8 \frac{m_j R_j}{p_j^3} = -\alpha \operatorname{sign}(\alpha) \left[ -\frac{5}{16} \frac{i q_3}{\alpha^7} + \frac{3}{8} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^6} + \frac{(1-\nu)}{\lambda_2^4} \frac{q_5}{\alpha^4} \right. \\ \left. + \frac{5(1-\nu)}{128} \frac{q_5}{\alpha^8} + \mathcal{O}(\alpha^{-10}) \right]$$

$$\sum_1^8 \frac{m_j R_j}{p_j^2} = -\alpha \operatorname{sign}(\alpha) \left[ +\frac{3}{8} \frac{i q_3}{\alpha^5} - \frac{1}{2} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^4} + \frac{3\kappa\lambda_2^2\lambda^2}{128} \frac{q_4}{\alpha^6} \right. \\ \left. - \frac{(1-\nu)}{16} \frac{q_5}{\alpha^6} + \mathcal{O}(\alpha^{-8}) \right]$$

$$\sum_1^8 \frac{m_j R_j}{p_j} = -\alpha \operatorname{sign}(\alpha) \left[ -\frac{1}{2} \frac{i q_3}{\alpha^3} + \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{q_4}{\alpha^2} - \frac{1}{16} \kappa\lambda_2^2\lambda^2 \frac{q_4}{\alpha^4} \right. \\ \left. + \frac{(1-\nu)}{8} \frac{q_5}{\alpha^4} + \mathcal{O}(\alpha^{-6}) \right]$$

$$\sum_1^8 m_j R_j = -\alpha \operatorname{sign}(\alpha) \left[ \frac{i q_3}{\alpha} + \frac{3}{8} \kappa\lambda_2^2\lambda^2 \frac{q_4}{\alpha^2} - \frac{(1-\nu)}{2} \frac{q_5}{\alpha^2} + \mathcal{O}(\alpha^{-4}) \right]$$

$$\sum_1^8 p_j m_j R_j = -\alpha \operatorname{sign}(\alpha) \left[ \frac{3}{2} \kappa\lambda_2^2\lambda^2 q_4 - (1-\nu) q_5 + \mathcal{O}(\alpha^{-2}) + \mathcal{O}(\alpha^{-2}) \right] \quad (\text{B.24})$$

To be able to complete the asymptotic analysis, evaluation of the second terms appearing at the righthand side of (B.2), (B.3) and (B.5) as  $\alpha \rightarrow \infty$  is required. As an example, lets evaluate the following term in (B.2)

$$-\frac{\kappa(1-\nu)}{2} \alpha \ell (A_1 + A_2) \quad (\text{B.25})$$

Recalling equation (3.1.69)

$$-\frac{\kappa(1-\nu)^2\alpha i}{2}r_2(A_1 + A_2) = \sum_1^4 \frac{\rho_j + (1-\nu)\alpha^2}{\kappa\rho_j - 1}R_j - \sum_5^8 \frac{\rho_j + (1-\nu)\alpha^2}{\kappa\rho_j - 1}R_j \quad (\text{B.26})$$

and multiplying both sides by  $1/(1-\nu)r_2$ , following expression can be found as

$$-\frac{\kappa(1-\nu)\alpha i}{2}(A_1 + A_2) = \frac{1}{(1-\nu)r_2} \left[ \sum_1^4 \frac{\rho_j + (1-\nu)\alpha^2}{\kappa\rho_j - 1}R_j - \sum_5^8 \frac{\rho_j + (1-\nu)\alpha^2}{\kappa\rho_j - 1}R_j \right] \quad (\text{B.27})$$

Using (B.15), (B.18), (B.20) and (B.22), righthand side of (B.27) can be expressed in terms of  $q_i$  as follows

$$-\frac{\kappa(1-\nu)\alpha i}{2}(A_1 + A_2) = \frac{1}{r_2} \left[ -\alpha q_3 + \kappa(1-\nu)\alpha^2 q_5 + q_5 \right] \quad (\text{B.28})$$

Using asymptotic expansion

$$\frac{1}{r_2} = \frac{1}{|\alpha|} \left( 1 - \frac{1}{\alpha(1-\nu)\alpha^2} + \frac{3}{2\kappa^2(1-\nu)^2\alpha^4} \dots \right) \quad (\text{B.29})$$

and neglecting lower order terms, asymptotic value of (B.25) can be found as follows

$$\lim_{\alpha \rightarrow \infty} \left[ -\frac{\kappa(1-\nu)\alpha i}{2}(A_1 + A_2) \right] = \text{sign}(\alpha) \left[ iq_3 + \frac{iq_3}{\kappa(1-\nu)\alpha^2} + \kappa(1-\nu)\alpha q_5 + \frac{1}{2\kappa(1-\nu)} \frac{q_5}{\alpha^3} + O(\alpha^{-4}) \right] \quad (\text{B.30})$$

In a similar way, also using the asymptotic expansions of  $r_1$  and  $r_2$ , given in (3.1.102) and (3.1.103) respectively, asymptotic values of second terms appearing at the righthand side of (B.2) and (B.5) can be written as follows

$$\lim_{\alpha \rightarrow \infty} \left[ -\frac{\kappa(1-\nu)^2 \alpha i}{2} (r_1 A_1 + r_2 A_2) \right] = \text{sign}(\alpha) \left[ \kappa(1-\nu)^2 \alpha^2 (iq_2) + (1-\nu)(iq_2) + \frac{1}{2\kappa} \frac{iq_2}{\alpha^2} + O(\alpha^{-4}) \right]$$

$$\lim_{\alpha \rightarrow \infty} \left[ \frac{\kappa(1-\nu)\alpha i}{4} (\alpha^2 + r_1^2)(A_1 + A_2) \right] = \text{sign}(\alpha) \left[ (1-\nu)\alpha q_3 + \frac{1}{2\kappa^2(1-\nu)} \frac{q_3}{\alpha^3} + \kappa(1-\nu)^2 \alpha^2 (iq_5) + (1-\nu)(iq_5) + \frac{1}{2\kappa} \frac{iq_5}{\alpha^2} + O(\alpha^{-4}) \right] \quad (\text{B.31})$$

Finally, using the results given in (B.17) and (B.24), and following the procedures described above, asymptotic values as  $\alpha \rightarrow \infty$  for the first terms at the righthand side of (B.1) through (B.5) can be obtained. Combining these and (B.30), (B.31) asymptotic values of  $K_{\alpha, i}$  ( $i=1, \dots, 5$ ) can be found as

$$K_{\alpha, 1} = \text{sign}(\alpha) \left[ \frac{1}{2} (iq_1) + \frac{1}{64} \kappa \lambda^4 \frac{iq_1}{\alpha^2} - \frac{(1+\nu)}{16} \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{iq_2}{\alpha^2} + O(\alpha^{-4}) \right]$$

$$K_{\alpha, 2} = \text{sign}(\alpha) \left[ -\frac{(1-\nu^2)}{2\lambda^4} (iq_2) - \frac{1}{2\kappa\lambda^4} \frac{iq_2}{\alpha^2} + \frac{(1+\nu)}{16} \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{iq_1}{\alpha^2} + O(\alpha^{-4}) \right]$$

$$K_{\alpha, 3} = \text{sign}(\alpha) \left\{ -iq_3 + \left[ \frac{\kappa\lambda_2^4}{16} + \frac{1}{\kappa(1-\nu)} \right] \frac{iq_2}{\alpha^2} - \frac{3}{8} \kappa \lambda_2^2 \lambda^2 \frac{q_4}{\alpha} + \left[ \frac{1}{2\kappa(1-\nu)} - \frac{5\kappa(1-\nu)\lambda_2^4}{128} \right] \frac{q_5}{\alpha^3} + O(\alpha^{-4}) \right\}$$

$$K_{as,4} = \text{sign}(\alpha) \left\{ -\frac{1}{2} i q_4 + \frac{5}{128} \kappa \lambda^4 \frac{i q_4}{\alpha^2} + \frac{1}{8} \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{q_3}{\alpha} + \frac{(1-\nu)}{16} \left( \frac{\lambda_2}{\lambda} \right)^2 \frac{i q_5}{\alpha^2} + O(\alpha^{-4}) \right\}$$

$$K_{as,5} = \text{sign}(\alpha) \left\{ \frac{(1-\nu^2)}{2\lambda_2^4} i q_5 + \frac{1}{2\kappa\lambda_2^4} \frac{i q_5}{\alpha^2} + \left[ \frac{3(1-\nu)}{128} + \frac{1}{2\kappa^2(1-\nu)} \right] \frac{1}{\lambda_2^4} \frac{q_3}{\alpha^3} + \frac{(1-\nu)}{16} \left( \frac{\lambda}{\lambda_2} \right)^2 \frac{i q_4}{\alpha^2} + O(\alpha^{-4}) \right\}$$

(B.32)

If the integration is performed from zero to infinity, it can be seen that only the first terms of equations given in (B.32) contribute to Simple Cauchy type singularities. Those terms which are the closed form solutions of the asymptotic integrals are added as singular terms and those asymptotic integrals in the closed form are subtracted from unbounded integrals under the integral sign as mentioned in Section 3.1.

## APPENDIX D

### EVALUATION OF SINE AND COSINE INTEGRALS

The exponential decaying property of the bounded kernels given in Appendix C is no longer valid as  $y \rightarrow t$ , since the power of exponent terms being almost zero. Thus, some terms obtained in Appendix B, which have been disregarded in the formulation of the problem, i.e. during singularity extraction, will now be considered.

Analyzing B.32, it can be seen that the first terms have already been considered to be able to extract singularities and to satisfy convergence. Their effects were extracted from the unbounded kernels. The lower order terms, i.e. the remaining ones, constitute the subject of this chapter.

Consider, for example, the typical kernel  $k_{44}$  which appear in the integral equation (3.1.105). Referring to equation (C.19) in Appendix C, let

$$\begin{aligned}
 F_{44}(\alpha) &= \sum_{j=1}^8 \alpha K_j m_j D_j(\alpha) \\
 &= \left( \frac{\lambda_2}{\lambda} \right)^2 \sum_{j=1}^8 \alpha \frac{m_j (p_j + \alpha^2)}{p_j^2} D_j(\alpha)
 \end{aligned} \tag{D.1}$$

The asymptotic values of fourth integral equation were obtained as  $k_{as,4}$  in Appendix B. By using (3.1.88) and (B.32), the asymptotic value of  $F_{44}$  can be evaluated as

$$F_{44} \Big|_{\alpha \rightarrow \infty} = \frac{i}{2\alpha} - \frac{5\kappa\lambda_2^4}{128} \frac{i}{\alpha^2} \tag{D.2}$$

Finally, by using equation (B.19), the kernel  $k_{44}$  can be expressed as

$$\begin{aligned}
k_{44}(\sqrt{c\tau}, \sqrt{c\eta}) = & -\int_0^A 2\alpha \operatorname{Re} \left( \sum_{j=1}^8 K_{j,m} D_j - 2 \sum_{j=5}^8 K_{j,m} D_j e^{-2m_j t} \right) \\
& \cos \alpha \sqrt{c}(\tau - \eta) d\alpha + \int_0^A \left[ 2\alpha \operatorname{Im} \left( \sum_{j=1}^8 K_{j,m} D_j - \right. \right. \\
& \left. \left. - 2 \sum_{j=5}^8 K_{j,m} D_j e^{-2m_j t} \right) - 1 \right] \sin \alpha \sqrt{c}(\tau - \eta) d\alpha - \\
& \frac{5\kappa\lambda_2^4}{64} \int_A^\infty \frac{\sin \alpha \sqrt{c}(\tau - \eta)}{\alpha^2} d\alpha.
\end{aligned} \tag{D.3}$$

The value of the last integral is evaluated by using integration by parts as follows

$$\int_A^\infty \frac{\sin \alpha \sqrt{c}(\tau - \eta)}{\alpha^2} d\alpha = -\frac{\sin \alpha \sqrt{c}(\tau - \eta)}{\alpha} \Big|_A^\infty + \sqrt{c}(\tau - \eta) \int_A^\infty \frac{\cos \alpha \sqrt{c}(\tau - \eta)}{\alpha} d\alpha \tag{D.4}$$

The integral in (D.4) is given as cosine integral in [25] as follows

$$\int_A^\infty \frac{\cos \alpha \sqrt{c}(\tau - \eta)}{\alpha} d\alpha = -Ci \left[ A\sqrt{c}(\tau - \eta) \right] \tag{D.5}$$

Substituting (D.5) into (D.4), following result can be obtained

$$\int_A^\infty \frac{\sin \alpha \sqrt{c}(\tau - \eta)}{\alpha^2} d\alpha = \frac{\sin A\sqrt{c}(\tau - \eta)}{A} - \sqrt{c}(\tau - \eta) Ci \left[ A\sqrt{c}(\tau - \eta) \right] \tag{D.6}$$

Similar analysis are done for the other kernels and they are reduced into the following form

$$\begin{aligned}
k_{11}(\sqrt{c\tau}, \sqrt{c\eta}) = & \int_0^A \left[ 2\alpha^2 \operatorname{Re} \left( \sum_{j=1}^8 K_j Q_j - 2 \sum_{j=5}^8 K_j Q_j e^{-2m_j t} \right) - \right. \\
& \left. - 1 \right] \sin \alpha \sqrt{c}(\tau - \eta) d\alpha + 2 \int_0^A \alpha^2 \operatorname{Im} \left( \sum_{j=1}^8 K_j Q_j - \right.
\end{aligned}$$

$$\left. -2 \sum_{j=5}^8 K_j Q_j e^{-2m_j l} \right\} \cos \alpha \sqrt{c}(\tau - \eta) d\alpha - \frac{\kappa \lambda_2^4}{32} \int_A^\infty \frac{\sin \alpha \sqrt{c}(\tau - \eta)}{\alpha^2} d\alpha \quad (D.7)$$

$$\begin{aligned} k_{12}(\sqrt{c}\tau, \sqrt{c}\eta) = & \int_0^A 2\alpha^2 \operatorname{Re} \left( \sum_{j=1}^8 K_j N_j - 2 \sum_{j=5}^8 K_j N_j e^{-2m_j l} \right) \\ & \sin \alpha \sqrt{c}(\tau - \eta) d\alpha + 2 \int_0^A \alpha^2 \operatorname{Im} \left( \sum_{j=1}^8 K_j N_j - \right. \\ & \left. - 2 \sum_{j=5}^8 K_j N_j e^{-2m_j l} \right) \cos \alpha \sqrt{c}(\tau - \eta) d\alpha + \\ & \frac{(1+\nu)}{8} \left( \frac{\lambda_2}{\lambda} \right)^2 \int_A^\infty \frac{\sin \alpha \sqrt{c}(\tau - \eta)}{\alpha^2} d\alpha \end{aligned} \quad (D.8)$$

$$\begin{aligned} k_{13}(\sqrt{c}\tau, \sqrt{c}\eta) = & \int_0^A 2\alpha^2 \operatorname{Re} \left( \sum_{j=1}^8 K_j C_j - 2 \sum_{j=5}^8 K_j C_j e^{-2m_j l} \right) \\ & \sin \alpha \sqrt{c}(\tau - \eta) d\alpha + 2 \int_0^A \alpha^2 \operatorname{Im} \left( \sum_{j=1}^8 K_j C_j - \right. \\ & \left. - 2 \sum_{j=5}^8 K_j C_j e^{-2m_j l} \right) \cos \alpha \sqrt{c}(\tau - \eta) d\alpha \end{aligned} \quad (D.9)$$

## APPENDIX E

### EDGE CRACK STRESS INTENSITY FACTOR CURVE FITTING

The line spring model is based on two assumptions. The first, previously stated, involves replacing the net ligament (in which the state of stress is two dimensional), by resultant forces which are functions of  $y$  only. The second assumption is that the stress intensity factors along the crack front may be obtained from these resultant forces as though the stress state were one of plane strain.

In order to make use of this analogy, the plane strain stress intensity factor solution for an edge-cracked strip must be available for the five possible loading conditions in a shell on a given surface. These solutions are presented along with a curve fit in the form,

$$p_i(\xi) = \frac{\sqrt{\xi}}{(1-\xi)^{3/2}} \sum_{k=0}^{12} C_k \xi^k, \quad (i=1,2)$$

$$p_i(\xi) = \frac{\sqrt{\xi}}{(1-\xi)^{1/2}} \sum_{k=0}^8 C_k \xi^k, \quad (i=3,4,5)$$

where  $l$  is the crack depth, and the variable  $\xi$  is the ratio of the depth  $l$  to the strip thickness  $h$ , i.e.  $\xi = l/h$ . The constants  $C_k$  are given in Table E.1 and Table E.2.

Table E.1. The Compliance Coefficients for  $p_1(\xi)$  and  $p_2(\xi)$   
for tension and bending respectively.

## VITA

Müfit Gülgeç was born on March 13, 1959 in Ankara. He graduated in 1980 from Ankara State Academy of Architecture and Engineering with Bachelor of Science in Mechanical Engineering. He worked as a Research Assistant for the Department of Mechanical Engineering, Gazi University until 1988 and earned a Masters of Science Degree in Mechanical Engineering from the Middle East Technical University in 1986. In the same department, he started his Ph.D. study in 1986. He has been working as an Instructor in the Mechanical Engineering Department, Gazi University since 1988.

He is married to Sema Gülgeç and they have a daughter, Sıla.
