ABSTRACT

PUBLICATION TRENDS OF RESEARCHERS IN TURKEY IN WEB OF SCIENCE EDUCATION AND EDUCATIONAL RESEARCH SUBJECT FIELD: A DESCRIPTIVE TREND ANALYSIS

Tür, Nurcan

M.S., Department of Computer Education and Instructional Technology

Supervisor: Prof. Dr. Soner Yıldırım

August 2019, 106 pages

The main aim of this research was to employ bibliometric analysis methods to understand the general trends of peer-reviewed educational articles indexed under the subject areas of “education and educational research” Web of Science bibliometric databases that is the first and well-known bibliometric databases , between 1968 and 2015. This study analyzed a total of 10,729 documents 6,644 of which were articles based on the journal of publication, author institutional affiliation, and co-author collaboration. The current research applied a modified version of the method used by Zancanaro, Todesco, and Ramos (2015). This method has two main steps: (1) Collecting, filtering, and data standardization (2) Data analysis and synthesis

The results showed that when looking at the annual distribution of the published articles, incentive programs have been shown to be helpful as a means to improving the volume of articles. In summary, 50% of the articles originated from 15 universities and the majority of published journals have an impact value below 1,00. Of the 10% articles were based on authors having collaborated with a researcher whose affiliate

address is located outside of Turkey. The United States of America, the United Kingdom, and Germany were the countries most collaborated with by Turkish academics in their educational research.

Keywords: Education, Bibliometry, Bibliometric Research, Publication Trend, WOS, Research, Co-authorship, Collaboration Trends

Ağustos 2019 , 106 sayfa

Bu çalışma kapsamında; ilk bibliyometrik veri tabanı olma özelliğine sahip ve yaygın olarak kullanılan Web of Science veritabanında 1968-2015 yılları arasında eğitim ve eğitim bilimleri alanında indekslenmiş olan yayınlar; türleri, yayımlandıkları dergiler, yazarların kurumları ve yazarların diğer yazarlar ile yaptıkları iş birlikleri yönünden 6.644'ü makale türünde olmak üzere 10.729 yayın bibliyometrik analiz metodu kullanılarak incelenmiştir. Bu çalışmada Zaccanaro, Todesco ve Ramos (2015) tarafından kullanılan metodun çalışmaya uygun şekilde düzenlenmiş hali kullanılmıştır. Araştırma metodu temel olarak iki aşamadan oluşmaktadır: (1) Veri toplama, filtreleme ve standardizasyon (2) Veri analizi ve sentezi

Yapılan çalışma sonucunda uluslararası yayınların artmasına yönelik sağlanan teşviklerin ve yürütülen politikaların etkileri yıllara göre yayın dağılımları dikkate alındığında gözlenebilmektedir. Eğitim bilimleri alanında gerçekleştirilen çalışmaların %50'sinin 15 üniversiteden kaynaklandığı ve yayın yapılan dergilerin çoğunluğunun etki değerlerinin 1,00'in altında olduğu görülmüştür. Ortak yazarlı yayınlar işbirliği

yönünden incelendiğinde ise yayınların yaklaşık %10'unda yabancı yazarlar ile çalışıldığı ve en çok Amerika Birleşik Devletleri, İngiltere ve Almanya ile birlikte araştırma çalışmaları yürütüldüğü görülmüştür.

Anahtar Kelimeler: Eğitim, Bibliyometrik Analiz, Trend Analizi, WOS, Bilimsel Yayın, İşbirliği

To my grandmother,
she will always be in my heart.

ACKNOWLEDGMENTS

There are many people I would like to thank for their valuable comments and guidance. First of all, I should thank my advisor, Prof. Dr. Soner Yıldırım, for his guidance, criticism, and endless patience.

Moreover, I should also like to sincerely thank my instructor, Dr. İlker Yakın, who encouraged me to return to my Master's studies and to complete my research. Additionally, I must extend my thanks to Assoc. Prof. Dr. Vehbi Sanalan as someone who believed in me more than I did myself, and who was always available to provide guidance throughout my research journey.

My dearest friend, Mirun Akyüz, deserves my deepest gratitude for helping with the bibliometric databases and data collection process of the study. I also want to thank Hakan Bayındır and Orkun Balcı for their technical guidance, and to Seçkin Köknar for his support and never-ending patience.

Lastly, I would like to thank to my family; my brother Yahya, and my dear parents, Nuran and Mehmet, for their everlasting support, courage, and for their love.

CHAPTER 1

INTRODUCTION

1.1 Background of the Study

Studies about scientific production date back to the 1920s. However, the 1960s saw the emergence of citation databases like the Science Citation Index (SCI), and a simultaneous academic explosion in this newly emerging field as more researchers moved to address its issues. Over the years, different names have been applied to scientific production studies such as statistical bibliometrics, bibliometrics, science of science, and scientometrics etc. With the rapid improvements seen in technology, new terms have also been added such as webometrics, technometrics, informetrics, and cybermetrics. See Figure 1.1 for an illustration of the various terms by Jacobs (2010).

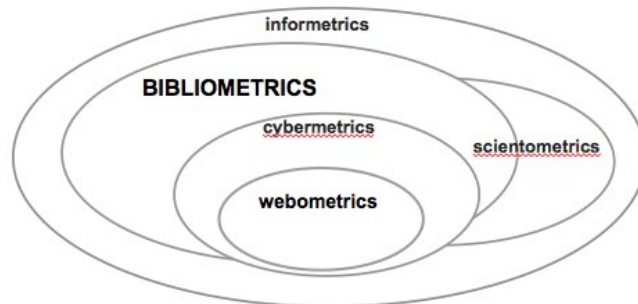

Figure 1.1: Interaction of different metrics (p. 10)

Today, the boundaries of these different terms have become increasingly specified. On the other hand, terms such as scientometrics, bibliometrics, and statistical bibliometrics can be seen used interchangeably in the literature, and any slight boundaries have vanished over the years (Glänzel, 2003). As a whole, this multidisciplinary

field of study has taken on the name “information science” under the area of library sciences.

Bibliometrics used wide range of different scopes Okubo (1997, p. 9) grouped them into four categories: “

- the **history of science**, where it elucidates the development of scientific disciplines by tracing the historical movements that are revealed in the results obtained by researchers;
- the **social sciences**, where, by examining scientific literature, it underpins analysis of the scientific community and its structure in a given society, as well as the motivations and networks of researchers;
- **documentation**, where it can count the number of journals per library and identify the journals that constitute the core, secondary sources and periphery of a discipline (by analyzing the quantity of journals needed to cover 50 per cent, 80 per cent or 90 per cent of the information in a given area of science);
- **science policy**, where it provides indicators to measure productivity and scientific quality, thereby supplying a basis for evaluating and orienting R&D.

” In today’s world, information is a powerful tool for both individuals and for countries. The World Bank suggests the following for national policymakers (The World Bank, 2013).

In order to take part in knowledge economy, countries should be aware of these four pillars:

- An educated and skilled population is needed to create, share and use knowledge.
- A dynamic information infrastructure ranging from radio to the Internet is required to facilitate the effective communication, dissemination and processing of information.
- A regulatory and economic environment that enables the free flow of knowledge, supports investment in Information and Communications Technology (ICT), and encourages entrepreneurship is central to the knowledge economy.
- A network of research centers, universities, think tanks, private enterprises and community groups is necessary to tap into the growing stock of global knowledge, assimilate and adapt it to local needs, and create new knowledge.(para.1)

In order to remain in the world’s top countries, policymakers should consider the current state of these four pillars and take the necessary precautions and plan for regulatory activities. The third and fourth pillars are directly related with research

productivity, which was defined as “the number of publications per researcher, discipline, department, institution, region or nation” (e.g., Abramo & D’Angelo, 2014, p. 1). As knowledge creation and dissemination is one of the important aspects of knowledge economy, research productivity is also one of the key indicators used in assessing a country’s level of development.

National policymakers systematically analyze the scientific and technological growth of the country in order to achieve sustainable growth. In Turkey, the foundation responsible which leads the activity of the Supreme Council for Science and Technology (known in Turkish as BTYK) is TÜBİTAK (The Scientific and Technological Research Council of Turkey). The Turkish Academic Network and Information Center (ULAKBİM) is the responsible institution operating under TÜBİTAK that conducts and publishes bibliometric studies for the measurement of Turkey’s performance in the production of international scientific publications (ULAKBİM, 2013). Bibliometric studies are conducted for the purposes of;

- ranking countries for their scientific performance,
- comparing countries,
- understanding the levels of co-operation between countries and/or institutions,
- evaluating the productivity of a person or institution,
- understanding the current state on a subject (Çiftçi et al., 2016; Danışman et al., 2016).

Turkey’s vision for 2011-2016 was stated as being, “to produce knowledge and develop technologies which serve the country and mankind by the means of innovative products, processes and services” (TÜBİTAK Bilim Teknoloji ve Yenilik Politikaları Daire Başkanlığı, 2010, p.3). The most productive countries during the period 2010 to 2015 were the United States of America with 3,660,831 publications, China with 1,678,221 publications, and the United Kingdom with 904,456 publications. Turkey was ranked 18th for the same period with 204,216 publication (Yetkin, Büyükçınar, & Akıllı, 2015b). When considering just the social sciences, Turkey produced 25,950 publications, and 28.64% of these were classified as Education and Education Re-

search, followed by Economy (9.05%), and Social Sciences–Common Disciplines (7.52%) (Yetkin, Büyükçınar, & Akıllı, 2015a).

Although ULAKBİM prepare these reports periodically, they merely provide generalized data about Turkey’s scientific productivity. Therefore, the primary aim of the current research was to conduct a more detailed analysis of peer-reviewed educational research articles indexed in a major scientific research publication index service for the “Education and Educational Research” subject areas, with at least one author’s affiliate address located in Turkey.

1.2 Purpose of the Study

The purpose of the current study is to describe the current trends of peer-reviewed educational research articles indexed in a major scientific research publication index service under the “education and educational research” subject area, and with at least one author’s affiliate address located in Turkey. The study aims to analyze research articles according to their bibliographic information such as journal name, author affiliation (academic institution), title, publication type, and publication year etc. The analysis intends to reveal generalized research profiles, which journals are the most preferred, and the prevalent sample demographics. The results aim to shed light on the educational research area as a scientific endeavor, and on the general trends to extrapolate research policy. Additionally, the study is expected to be useful to novice researchers in setting their research agenda.

1.3 Research Questions

Main question: What are the publication and collaboration trends in the field of educational sciences, especially in the Computer Education and Instructional Technology (CEIT) departments?

Subquestion 1: What are the general publication trends and bibliometric profiles of publications in the fields of educational sciences?

- a) What is the distribution by year of documents indexed in the Web of Science Core Collection under the “education and educational research” subject, with at least one author’s affiliate address located in Turkey?
- b) What is the distribution of documents according to each index?
- c) What is the distribution of research articles according to journals grouped by the 5-Year Impact Factor (5-YIF)?
- d) What is the distribution of research articles according to the authors’ institution type?
- e) Which are the top 15 universities according to the numbers of published research articles?

Subquestion 2: What are the bibliometric profile of journals originating from the top 15 universities and CEIT departments?

- a) Which are the journals most preferred by the top 15 universities?
- b) Which are the journals most preferred by CEIT departments?

Subquestion 3: What are the collaboration trends among researchers from the top 15 universities?

- a) What is the research article co-authorship distribution by country?
- b) What is the research article co-authorship distribution for the top 15 universities?
- c) What is the research article co-authorship distribution by CEIT departments?

1.4 Significance of the Study

National bibliometric profiles provide valuable information such as which countries scientifically collaborate, and the effectiveness of their governmental policies etc. Scientifically analyzing national bibliometric profiles is one way in which researchers

can reveal the current state of a country, its institutions, or the collaborative patterns (as explained in Section 1.1). In recent years, the popularity of research trend analyses has increased. These studies have been conducted against whole citation indexes (e.g., Al, 2008; Gülgöz, Yedekçioğlu, & Yurtsever, 2002)), based on only a specific topic (e.g., Zancanaro et al., 2015) or based on specific journals (e.g. Günay & Yakın, 2014).

In the literature, there have been bibliographical research studies based on a single subject category as the study scope (e.g. Montero-Díaz, Cobo, Gutiérrez-Salcedo, Segado-Boj, & Herrera-Viedma, 2018). On the other hand, there has been no such research studies based on academic publications originating from Turkey and indexed in the Web of Science Core Collection under the “Education and Education Research” subject category. The current research aims to descriptively analyze publications indexed under the Web of Science Core Collection “Education and Educational Research” subject category that originated from Turkey between 1968 and 2015. This scope provides a sufficiently broad coverage and the opportunity to investigate the general trends in the field of education for scientific productivity and cooperation patterns among institutions.

1.5 Limitations and Assumptions

The research sample and subsequent analysis was limited to;

- publications between 1968 and 2015,
- documents indexed in the Web of Science core databases under the “education and educational research” subject, and with at least one author’s affiliate address located in Turkey,
- only the most productive 15 universities were considered for research sub-questions 2 - a, 3 - a and 3 - b.

The journals listed under the examined subject areas of the databases were assumed to be related with education. When calculating the most productive institutions, only the number of publication was taken into account.

1.6 Definitions and Terms

Bibliometrics: “Quantitative analyses of publication data using document, author, or source (e.g., journal) level data elements to uncover characteristics, patterns, and relationships to demonstrate individual investigator or research team productivity, quality, or impact” (Carpenter, Cone, & Sarli, 2014, p. 1161)

CHAPTER 2

LITERATURE REVIEW

As a result of knowledge economy, policymakers should support knowledge production in their respective countries. As mentioned in Chapter1, the creation, dissemination, and usage of knowledge is considered one of the important pillars in knowledge economy. In knowledge production activities, the number of patents, research papers, and research citations reported in bibliometric databases are seen as important indicators. In order to increase these activities, many countries prepare incentive programs to encourage researchers to publish research.

This chapter addresses four main parts; scientific production in Turkey, bibliometrics and the history of bibliometric indexes, bibliometric studies, and criticism about the use of bibliometry.

2.1 Scientific Production in Turkey

Scientific progress is always based on previous studies like a snowball. Sometimes researchers add new information to past studies, and sometimes they refute previously published theories, propose a new one, or attempt to justified existing theories. In this production of scientific information, scholarly communication is the most important phase in order to disseminate the newly produced knowledge to other researchers.

The same worldwide, universities in Turkey are the institutions primarily responsible for the production of scientific knowledge, with other sources being research and development centers or entrepreneurs undertaking research and development (R&D) activities. For each of these actors there are different incentive programs in place. For

entrepreneurs, the Ministry of Science and Technology and Turkish Scientific Council (TÜBİTAK) announces calls for proposals. For academicians in Turkey, in addition to TÜBİTAK, The Council of Higher Education (CoHE) and also some universities provide incentives and promotions based on research activities.

One of the most important motivators for publishing research for academicians, apart from the broadcasting of their work and professional notoriety, is its necessity in order to accomplish academic promotion or to support a job application (Demir, Demir, & Özdemir, 2017). The first regulation related to an examination for associate professorship was published in the Turkish Official Gazette on July 11, 1983. One of the conditions set in this regulation was the undertaking of original academic research and publishing research (Başbakanlık Neşriyat Daire Başkanlığı, 1983). In order pass the examination for associate professorship, candidates were required to give an exemplary lecture to the examination committee members, and this stayed in place until 2000. On September 1, 2000, the regulations were updated and the exemplary lecture requirement was removed, and the focus on research activity and publications enhanced (Başbakanlık Mevzuatı Geliştirme Yayın Genel Müdürlüğü, 2000). In 2001, it was then made compulsory to have achieved internationally indexed publications (Yavan, 2005). This regulatory change provided an important motivating factor for academicians seeking professional career advancement to publish their work in journals indexed in certain international databases.

In addition to being a criteria for promotion, there are numerous incentive programs in Turkey that encourage academics to publish their works internationally. The Incentive Program for International Scientific Publications (known in Turkish as UBYT) was the first incentive program to promote international publication, and was started in 1993. Incentives are given to authors affiliated to Turkish establishments who publish in journals indexed in the Web of Science Core collection under the following databases:

- Science Citation Index Expanded
- Social Science Citation Index
- Art and Humanities Citation Index

“ ...more than 285,000 authors of some 157,000 publications (93% of which were papers / articles) were supported between 1997 and 2015. The total amount of support was about 124 million Turkish Liras (in 2015 current prices; equal to c. 35 million USD). (Tonta, 2017b, p. 24) ”

In 2019, the highest incentive amount available is 15,000 TL, with the lowest being 500 TL (ULAKBIM, 2019). According to Tonta (2017a), the UBYT program supports a number of international publications; however, there is no significant evidence on the quality improvement of the publications. According to publication numbers, Turkey was ranked 18th in the world between 2010 and 2015, but mostly in journals with an impact factor below 1.00 (Yetkin et al., 2015b). In addition to the UBYT incentive program, in 2016, academic incentives started to be paid direct to academicians by the Turkish Government. Paid monthly, the incentives are based on points scored from academic studies during the previous year (Okumuş & Yurdakul, 2017).

These are the two main forms of incentives made available to Turkish researchers. However, there are, of course, both positive and negative aspects to these incentive schemes. The main criticism levelled at such schemes is their not promoting the academic quality of publications, just focusing on the numbers (Al & Soydal, 2014; Balcı, 2011; Okumuş & Yurdakul, 2017)

2.2 Bibliometrics and History of Science Citation Index (SCI)

In order to understand the issues related to scientific production, researchers rely on publication data as the data source, and have applied a number of terms to this emerging research method as, science of science, scientometrics, informetrics, and bibliometrics. In the current study, the preferred term used is bibliometrics.

The history of publication counts stretches back to 1817. However, the first formal definition of bibliometrics was offered by Pritchard in 1969 as, “the application of mathematics and statistical methods to books and other media of communication” (p. 2). Over the years, the definition has broadened, and was more recently defined by Carpenter et al. (2014) as “Quantitative analyses of publication data using document, author, or source (e.g., journal) level data elements to uncover characteristics, patterns, and relationships to demonstrate individual investigator or research team

productivity, quality, or impact” (p. 1161).

Bibliometrics can be applied for different aims such as:

- understanding research trends,
- understanding the network of a scientific community,
- analyzing the productivity of a research team, country, or institution,
- determining science policy. (Danışman et al., 2016)

Bibliometric studies gained more attention after the development of the Science Citation Index (SCI), and advancements in technology have made databases more accessible through CD-ROM and web-based applications (Jacobs, 2010). Technology has enabled the databases to be usable by researchers for the conducting of more detailed studies. However, the history of bibliometrics actually predates the development of citation indexing. The idea and concept of these databases originates from the 12th century, with Hebrew Citation Indexes which were early examples of an embedded citation index which was printed in the margins of the Talmud (Weinberg, 1997). Citation indexing originated with “tables of cases cited,” which date back to at least 1743. Publication counts have been found in legal writings from as early as 1817 (Shapiro, 1992, p. 337), with the legal system placing significant importance to the recording of cases and their precedent cases.

According to Shapiro (1992), Raymond’s Reports is the oldest report, which was written by an English reporter in 1743. Raymond’s Reports contained “A Table of the Names of the Cases,” with the cited cases written in italics. Over the centuries, there have been other judicial reports and books written such as “Douglas’s Report” (1783), and “A Collection of Cases Overruled, Doubted, or Limited in their Application.” Sourced from American and English Reports (1821), Henry J. Labatt’s “A Table of Cases in California as Affirmed, Overruled, Modified, Commented upon, or Altered by Statutory Enactment” (1860), and “A Table of Cases Affirmed, Reversed or Cited in Any of the Volumes of the Reports of the State of New York” by William Wait (1872). In 1873, Shepard started indexing the Illinois Supreme Court cases and in time expanded it nationally within the United States of America. In 1997, Shepard’s

Citations were made available on the Internet and a new term was added to the judicial terminology, “Shepardizing,” which is the process by which the validity of a case is evaluated and additional authority located (*Shepard’s Citations Information Available on the Internet.*, 1997).

Shepard’s Citations therefore has significant importance in bibliometry, as in 1957, William C. Adair, a former Vice President of Shepard’s Content parent company, wrote a letter stating that the Shepard’s Citations indexing technique could be used for indexing medical literature. At that time, Eugene Garfield had kept in contact with Adair after being fired from the Welch Machine Indexing project in 1953 (Beira, 2010). Adair’s letter became a turning point for Garfield and also for bibliometrics.

Eugene Garfield (1925-2017) then founded the Science Citation Index (SCI). He was both a scientist and an entrepreneur. In 1954, Garfield set up DocuMation Inc., and used technology such as computer punch cards, digital computers, and CD Rom technology for the scholarly community as an information service provider. In 1955, he prepared an experimental citation index for patenting. In 1960, the company name changed to the Institute for Scientific Information (ISI). At the same time, the Index Chemicus was launched, which was an integrated chemical compound and reaction database that was fully linked to the citation index, and was supported by the National Science Foundation (NSF). In 1963, the first edition of the Science Citation Index (SCI) was launched, and covered the year 1961. In 1965, the Social Sciences Citation Index (SSCI) was launched. In 1970, the 5 years cumulating between 1965 and 1969 was calculated, and became known as it is today as the “5-year impact factor.” In 1975, the Journal Citation Report (JCR) was first published, and included journal impact factors. By 1980, all of these indexes and reports became available in CD-ROM form (Beira, 2010). These different databases then merged into the Web of Science portal, which can be accessed via the Internet (see <https://webofknowledge.com>), and is sustained by Thomson Reuters.

Today, the Web of Science is not the only citation index; however, it is the first citation index to cover different subjects, and also includes statistical calculations for impact factor assessment. Following the SCI, other citation indexes emerged such as MEDLINE, PsycINFO, Scopus, and Google Scholar etc. Some of these citation in-

dexes include only specific journal types like MEDLINE or PsycINFO. On the other hand, Scopus, Google Scholar, and the Web of Science includes all journal types.

Up until 2004, the WOS was the first and only bibliometric database, but with the opening of Elsevier's Scopus database, the WOS lost its unique status.

The fact that Scopus has emerged as another database that indexes references to scientific publications and has significantly increased the number of publications and citations it has covered in recent years, such as WOS, has attracted the attention of the scientific community. (Karasözen et al., 2011, p.239)

Due to this reason, in 2006 the WOS moved to enlarge its regional coverage, and the number of journals originating from Turkey increased up to 80 (Al & Soydal, 2014). At that time, the WOS did not precisely examine all of the journals when they accepted additional journals as part of their enlargement. There were only seven journals prior to 2005, but then 68 journals were added between 2005 and 2010 (Testa, 2011). However, due to citation abnormalities, almost half of these journals (30 of 65 journals accepted after 2007) were subsequently removed from the index (Al & Soydal, 2014).

After the complications seen following the regional coverage enlargement, the WOS moved instead to partner with regional databases. Today, there are three regional databases indexed through the Web of Science platform (*Web of Science platform: Regional Citation Indexes*, n.d.) which are:

- Russian Science Citation Index
- KCI Korean Journal Database
- SciELO Citation Index

Whilst the Web Of Science is therefore not the only citation database in existence, it is, however, still the most widely used database for incentive programs in Turkey. Due to this reason, this current research was based on data extracted from the Web of Science Portal.

2.3 Educational Faculties and CEIT Departments

In the 1970s, the Turkish Ministry of National Education (MoNE) were the responsible institution for training the nation's teachers. However, a number of critical decision errors were made such as the closure of Teacher Schools without undertaking the necessary planning, degrading the education provided by reducing the period of educational training from 3 years to 3 months, and using letter learning for teacher training degrees all detrimentally affected the quality of the teachers the system produced. Because of these negative practices, in 1982, Law No: 41 removed all teacher training responsibility from the MoNE, with responsibility passed to the universities. Teacher Training Schools were changed to Educational Faculties and their curricula replaced. In 2007, 23% of all undergraduate students in Turkey received their education through a total of 69 education faculties (Kavak, Aydın, & Akbaba ALTUN, 2007)

Within the improvements seen in technology, to develop on the ways to use technology within education, the Computer Education and Instructional Technology (CEIT) departments were established, along with curricula revisions applied to other programs within education faculties. By 2000, these new CEIT departments produced their first graduates (Akkoyunlu, 2010).

When looking at the current statistics from Turkey's Higher Education Council (CoHE), there are 201 universities in Turkey. Of those, 129 (64%) are state universities, with 72 (36%) being foundation (private) universities. When education faculties are examined, a total of 96 universities in Turkey have an education faculty, and 61 of them include the Computer Education and Instructional design field (CoHE, n.d.).

2.4 Bibliometrics Studies

As previously mentioned, bibliometric studies are conducted for different aims such as trend analysis, productivity analysis, to aid the defining of scientific policy, or for mapping scientific networks. The current research aims to understand the current research trends in Turkey for the field of education, and to reveal the widespread

research profiles, the most preferred journals, and the prevalent sample demographics.

In the literature, the first report which used bibliometric indicators was “Science Indicators,” published in 1972 by the National Science Foundation. After that, the NSF periodically published these indicators. It was the first attempt at using bibliometrics for the purposes of forming scientific policy. Today, countries give importance to understanding their current position in general research and development activities. The Organization for Economic Co-operation and Development (OECD), the Japan Science & Technology Agency (JST), and countries such as Australia, Brazil, Italy, the United Kingdom, the Netherlands, and Scandinavian countries have each prepared these kind of science and technology indicator reports for many years (Karasözen, Gökkurt, & Zan, 2009). In Turkey, ULAKBİM, which operates under TÜBİTAK, is the responsible institution that conducts bibliometric analysis related to science and technology. The ULAKBİM Bibliometric Analysis Group prepares reports with different scopes such as publication indicators for countries in different subjects, for universities, for cities, and for journals (ULAKBİM, 2013).

Their latest report included 52 countries and three groups (EU-28, OECD, and BRICKS) for the period 2010 to 2015. The report was based on data taken from the WOS Incites program. Worldwide, between 2010 and 2015, a total of 13,624,437 papers were indexed in the WOS databases. The most productive countries were the United States of America, China, and the United Kingdom. In this report, Turkey was ranked 18th, with 204,216 publications and with a 3.30 impact value having contributed to 1.5% of the world’s scientific publications between 2010 and 2015 (Yetkin et al., 2015b). When looking at the social sciences in detail, between 2010 and 2015, Turkey produced 12.27% of the total Social Sciences scientific research with 25,950 publications. The most significant research areas were Education and Educational Research (28.64%), followed by Economics (9.05%), and Social Sciences–Common Disciplines (7.52%) (Yetkin et al., 2015a) Figure 2.1 presents an illustration used by (Yetkin et al., 2015a).

It is important to note that in the Education and Educational Research field, Turkey was ranked sixth based on the number of publications. On the other hand, when the impact of these publications are assessed, Turkey was ranked 33rd.

Figure 2.1: Turkey's publication numbers for the top 10 social science subjects

In the literature, the number of bibliometric studies increased after 1990 (Al, 2008) following the SCI being made generally available. Bibliometrics can be applied at the macro and micro levels. Science indicator reports are sample-based at the macro level. Bibliometrics are also widely used for micro level studies such as understanding the current trends of a specific subject or journal.

Research by Bozkaya, Aydın, and Kumtepe (2012), Lee et al. (2007) and Selçuk, Palancı, Kandemir, and Dündar (2014) are all examples of conducting bibliometric analyses based on specific journals. These studies reported on what kind of research papers were published, which institutions had published in that journal, and how the journal quality and impact factor had changed over time. These bibliometric research studies helped researchers to understand the characteristics of the selected journal, and also identified general trends for the journals' subject area.

Using bibliometrics to understand current trends for a specific subject is one of the most common uses of bibliometrics. Yavan (2005) analyzed international publications in the field of geography in Turkey between 1945 and 2005, based on publica-

tions that appeared in journals covered by the SCI and SSCI citation indexes. Koçak (2014) looked at clinical medicine publications, and Karamustafaoğlu (2017)) analyzed Turkish physics publications indexed in the SCI from 1983 to 2003. Fatima and K S (2019) and Hung (2012) both studied e-learning as a subject, whilst Günay and Yakın (2014) chose both the subject area and seven specific journals in order to understand mobile learning trends.

Another area in which bibliometric analysis is significantly used is co-authorship and collaborative research. Zan (n.d.)) researched cooperation profiles in light of international articles produced by Turkey's Middle East Technical University (generally referred to as METU) and Bilkent University faculty members between 2001 and 2010. Glänzel (2001), Gossart and Özman (2008) and Melin and Persson (1996) also published research studies that looked for collaborative patterns between researchers or institutions.

Macro level studies can also be seen in the literature such as taking one of the databases as a whole and applying bibliometric techniques in order to reach generalized results. For example, Uzun (1998) conducted a bibliometric research for Turkey's social science publications between 1970 and 1999, whilst (Gülgöz et al., 2002) studied a similar timeframe with publications from 1987 to 1996.

The literature shows that bibliometrics can be applied at different aggregation levels. The aim of the current research is to understand the current trends of peer-reviewed articles indexed in the Web of Science Core Collection under the "education and educational research" subject between 1968 and 2015, and with at least one author's affiliate address located in Turkey.

2.5 Criticism About Bibliometry

In addition to the aforementioned advantages of bibliometry, there has also been criticism levelled at the use of bibliometrics in determining incentives for academic authors. The misuse or misapplication of bibliometrics have also been shown to have adverse effects, with Haustein and Larivière (2015) reporting on six different adverse effects as;

1. *Publishing in Journals that Count*: Researchers choose journals that count in their incentivization schemes rather than considering the quality of the journal. Balcı (2011) explained how this adverse effect is used by some researchers in order to meet the conditions set in their incentive programs for academic achievement and/or progression.
2. *Salami Publishing and Self-Plagiarism*: This is used for increasing publication numbers. Salami publication or segmented publication, as defined by Smolčić (2013) is “a distinct form of redundant publication which is usually characterized by similarity of hypothesis, methodology or results but not text similarity” (p. 1). This has an important unethical adverse effect because it is not easy to understand.
3. *Honorary Authorship*: This is ghost authorship. Listing individuals as authors who do not meet the authorship criteria or not naming the actual authors (Haustein & Larivière, 2015)
4. *Self-citations*: To some extent, self-citation is unavoidable; however, it depends on the context of the research. Some researchers use self-citations as a means to mislead bibliometric indicators.
5. *Increasing the Journal Impact Factor*: The Journal Impact Factor is an important indicator, but some journals have discovered ways to mislead this indicator using other adverse effects such as journal self-citation. In the peer review process, some editors push authors towards journal self-citation or to cite articles published in the preceding 2 years for the same journal etc.
6. *Cumulative or Personal Impact Factors*: These are other adverse effects whereby the journal impact factor is manipulated resulting in the cumulative and personal impact factors also being affected.

Following the enlargement decision of the Web of Science, the number of Turkish-originating journals increasing; however, some of them were also dropped from the index after approximately 5 years. The reason for these dropouts were mainly due to citation irregularities such as high rates of self-citation or the inclusion of more than 90% Turkish publications (Doğan, DHYI, & Al, 2018)

Bibliometry can draw a reliable and detailed picture of academic development at the micro or macro level. On the other hand, it should be considered that certain indicators can be manipulated through unethical practices. Policymakers should make themselves aware of such unethical implications and carefully consider these issues when awarding academic promotions and incentives.

CHAPTER 3

METHODOLOGY

The current study investigated the current trends of peer-reviewed educational research articles indexed in a major scientific research publication index service, having been submitted by researchers affiliated to institutions within Turkey. The aim of the study was not reach any prediction or explanation, but only to describe the current trends of education research articles where at least one author's affiliate address was located within Turkey.

This section includes detailed information about the design and methodology of the study. Section 3.1 includes the research questions. Section 3.2 details the design of the study. Section 3.3 includes information about the determination of a bibliometrical database and the publication period selected for the published articles. Section 3.4 includes the definition of the search terms applied. Section 3.5 provides information about the data collection methods employed. Section 3.6 includes information about the standardization and organization of the collected data. Finally, Section 3.7 includes information about the analysis and synthesis of the collected data.

3.1 Research Questions

The main research question of the current research is what the publication and collaboration trends are in the field of educational sciences, especially in the Computer Education and Instructional Technology (CEIT) departments. It includes three sub-questions:

Subquestion 1: What are the general publication trends and bibliometric profiles of publications in the fields of educational sciences?

- a) What is the distribution by year of documents indexed in the Web of Science Core Collection under the “education and educational research” subject, with at least one author’s affiliate address located in Turkey?
- b) What is the distribution of documents according to each index?
- c) What is the distribution of research articles according to journals grouped by the 5-Year Impact Factor (5-YIF)?
- d) What is the distribution of research articles according to the authors’ institution type?
- e) Which are the top 15 universities according to the numbers of published research articles?

Subquestion 2: What are the bibliometric profile of journals originating from the top 15 universities and CEIT departments?

- a) Which are the journals most preferred by the top 15 universities?
- b) Which are the journals most preferred by CEIT departments?

Subquestion 3: What are the collaboration trends among researchers from the top 15 universities?

- a) What is the research article co-authorship distribution by country?
- b) What is the research article co-authorship distribution for the top 15 universities?
- c) What is the research article co-authorship distribution by CEIT departments?

3.2 Design

Bibliometric analytical methods were applied in the study. Definition of bibliometrics highlights that quantitative methods are used in bibliometric research, and the current research applied a modified version of the method used by Zancanaro et al. (2015). Bibliometric analysis has two main steps and a number of sub-steps:

1. Collecting, filtering, and data standardization
 - (a) Determination of bibliometrical database(s) and the publication period of the articles
 - (b) Definition of the search terms to be applied
 - (c) Data Collection
 - (d) Organization and standardization of the collected data
2. Data analysis and synthesis
 - (a) Analysis of the collected data
 - (b) Analysis and preparation of the final result

3.3 Determination of Bibliometrical Database(s) and Publication Period of Articles

In the current research, the population of the study was all scholarly articles submitted under the educational and educational research area. The sampling of the research included research articles indexed in the Web of Science Core Collection under the “education and educational research” subject between the 1968 and 2015, with at least one of the authors having an affiliate address located within Turkey. In the main, there are three bibliometrical, cross-disciplinary databases:

- Google Scholar
- Web of Science (WOS)
- Scopus.

Google scholar is the database which has the broadest coverage (Harzing & Alakangas, 2016); however, it indexes all sources published on the web but without any expert control. Therefore, Google Scholar was excluded from the scope of the current research. Harzing and Alakangas (2016) conducted a longitudinal and cross-disciplinary comparative research study about these three aforementioned databases; concluding that, “all three databases provide sufficient stability of coverage to be used for more detailed cross-disciplinary comparisons” (p. 802).

Despite both the Web of Science and Scopus being used as bibliographical analysis tools and known to provide stability with regards their coverage, it is the Web of Science that is widely used in Turkey, and specifically for TÜBİTAK’s Incentivization Program for International Scientific Publications or Academic Incentives Allowance etc. It is for this reason that the sample for the current study was sourced from the Web of Science Core Collection databases.

The focus of the research was to establish the general image of current publication trends, primarily in the field of education. Under the Web of Science Core Collection there are individual 251 subject categories, and each journal indexed in the Web of Science is assigned to at least one subject category (Clarivate, 2018). The list of subject categories can be accessed from this link: [Web of Science Categories](#)

3.4 Definition of Search Terms

Main aim of this research was to create a picture of the current trends of peer-reviewed research articles that were indexed in a major scientific research publication index service under the “education and educational research” subject, and with at least one author’s affiliate address located within Turkey. In order to obtain accurate data from the Web of Science database, the following query was employed: “AD=Turkey AND WC=Education & Educational Research AND PY=(1968-2015)”

3.5 Data Collection

The Web of Science databases provide two different means to access indexed publications. The first of these is by utilizing the Web of Knowledge portal, which can be accessed by using this link: www.webofknowledge.com. The second is through a web-service in order to reach data presented via the website. However, rather than a browser, certain protocols are used instead. Using the web-service requires some basic code to be written in order to enter a query and thereby access the results. This method provides researchers with the opportunity to collect data more easily.

In the current research, a MySQL database was utilized in order to store and subsequently analyze the retrieved data. The collected data included metadata information about the research articles indexed in the Web of Science Core Collection under the education and educational research subject between 1968 and 2015, with at least one author's affiliate address located within Turkey. The data records included the following information:

- Wos Id,
- WOS Id,
- Document type,
- Publication year,
- Journal full title,
- Journal short title,
- Issue number,
- Volume number,
- First page number,
- Last page number,
- Authors' names,
- Authors' affiliations,

- DOI,
- Abstract,
- ISSN,
- eISSN.

The data was first extracted from the web service in August 2015, and repeated in November 2016 in order to include all of the records published during 2015. In total, the two extractions provided 10,729 records via the web service that covered in full the publications made between 1968 and 2015. However, the records included all types of documents such as articles, meeting notes, editorials, and reviews etc., but as the focus of the current research was only articles, this condition narrowed down the sample to provide metadata for 6,644 articles for analysis.

3.6 Organization and Standardization of Data

The data analysis phase of the study commenced with organization of the data. The data gathered from the web-service was in JSON format, and was subsequently parsed into a single MySQL table using Java programming language. The data also required additional parsing in order to create a relational database so as to be able to see the relationships between the records. For the second parsing process, Python programming language was then utilized.

After creating the relationship schema of the file, the data were then cleansed. Because the data included metadata information about each of the articles, it was not possible to discover the relations without first cleaning the data. Data cleansing formed an important part of this research as bibliometric databases are known to contain data that is not particularly clean. There are various reasons for such problems such as some documents having been digitalized using Optical Character Recognition (OCR) software, which can result in typographical errors, as well as authors or editors potentially submitting incorrect information etc.

One significant issue with the data taken from the bibliometric databases was a lack of identical organization listings, for example, the same addresses of an organization

having been written differently on different records. Therefore, without first cleaning the data, it would not be possible to reach a valid answer for Research Question 3. Taşkın (2012) stated having experienced the same issue that caused errors when analyzing university publication rankings through bibliometric analysis, and stated four major reasons as causes for this problem:

1. Letter and spelling mistakes
2. Indexing errors
3. Errors made in English translations of institution names
4. Non-standard address usage

All of these same problems were seen in the data of the current research that made cleansing the data prior to analysis unavoidable. In cleaning the data, a MySQL function was used to discover the variations of institution names and a normalization table was created to group the records according to the results.

3.7 Analysis and Synthesis of the Collected Data

After standardizing and cleansing the data, the final step was to execute the analytical queries so as to generate tables and images to answer the research questions, as stated in Section 1.3.

3.7.1 Collaboration Coefficiency

Understanding the level of academic collaboration among authors was not found to be an easy task using regular methods such as observation, interviews, or questionnaires. “Despite some limitations, bibliographic data containing the names of all the co-authors, offer an unobtrusive indicator for the study of collaboration” (Ajiferuke, Burell, & Tague, 1988).

Various methods have been employed such as Degree of Collaboration, Collaborative Index (Lawani, 1986), and Collaboration Coefficiency (Ajiferuke et al., 1988).Collab-

oration Coefficiency (CC) is shown as a value between 0 and 1, with the greater the number representing a higher level of collaboration. Although each of these methods has certain limitations, intelligible data in the CC method can be interpreted for the purposes of comparison between time periods, or between disciplines or institutions. Based on this approach, the researcher selected the CC method for the current study.

The formula for CC is as follows(Fatima & K S, 2019):

$$CC = 1 - \frac{\sum_{j=1}^A (1/j) f_j}{N} \quad (31)$$

where N is the total number of research papers published in a discipline during the certain period of time, j is the number of authors, f_j is the number of j -authored research papers published in a discipline during a certain period of time; and A is the greatest number of authors per paper in a discipline.

3.8 Data Validation

For data validation, the data analysis was conducted using different programs. Primarily, MySQL was used. In addition, the data was also analyzed using Microsoft Excel. As well as using different tools, the queries and database relations were peer reviewed by two computer engineers and an academician from the department of Computer Education and Instructional Technology (CEIT).

CHAPTER 4

FINDINGS

The main research question of the current study is what the publication and collaboration trends are in the field of educational sciences, especially in the Computer Education and Instructional Technology (CEIT) departments. This chapter precisifies the summary of findings in the light of three sub-research questions. Section 4.1 details the findings of the general publication trends and bibliometric profiles of publications in the fields of educational sciences. Section 4.2 includes the findings about bibliometric profile of journals originating from the top 15 universities and CEIT departments. Lastly, Section 4.3 contains the detailed findings of the collaboration trends among researchers from the top 15 universities.

4.1 General publication trends and bibliometric profiles of publications in the fields of educational sciences

4.1.1 Distribution of documents according to year

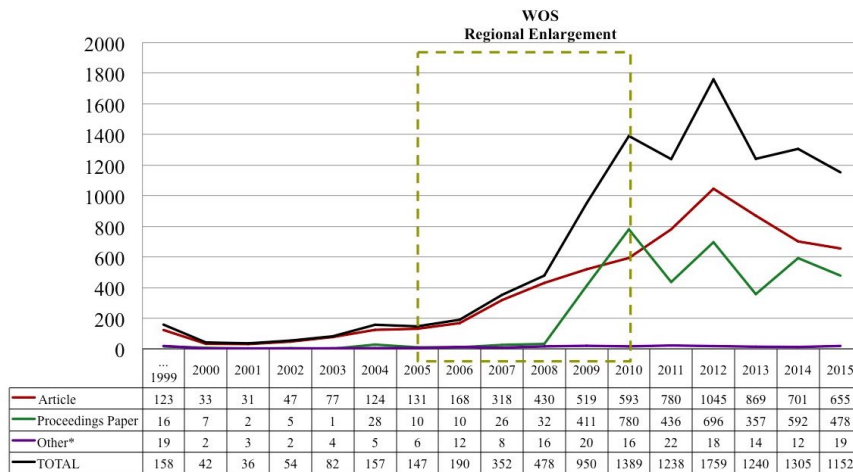

Figure 4.1: Distribution of documents by year

In this research, a total of 10,729 research papers were analyzed. The journals included different types of papers including articles, proceedings, abstracts, biographies, book reviews, editorials, letters, news, reviews, and software reviews. Between 1968 and 2015, researchers from Turkey published a total of 6,644 (61.92 %) research articles and 3,887 (36.23 %) proceedings papers.

Figure 4.1 illustrates the distribution of these papers by year of publication. The red line represents the distribution of the articles, the green line represents the proceedings papers and the purple line represents the other documents, which includes abstracts, biographies, book reviews, editorials, letters, news, reviews, and software reviews. Between the years 2005 and 2010, WOS increased the number of journals originating from Turkey within its regional enlargement strategy. The yellow rectangle in Figure 4.1 indicates the years when the WOS enlarge its regional coverage. It was obvious that in that years the number of publications were increased; on the other hand as WOS was not incisively examine the journals most of them extracted from the database because of their citation abnormalities.

4.1.2 Distribution of documents according to each index

Table 4.1: Full name of Web of Science indexes

Abbreviation	Edition full name
SCI	Science Citation Index Expanded
SSCI	Social Sciences Citation Index
AHCI	Arts & Humanities Citation Index
ISTP	Conference Proceedings Citation Index-Science
ISSHP	Conference Proceedings Citation Index-Social Sciences
IC	Index Chemicus
CCR	Current Chemical Reactions

In the Web of Science Core Collection there are seven indexes. These indexes are generally known by their abbreviated name – see Table 4.1 for the full name of each index. Index Chemicus (IC) was the first index which was created in 1960. SCI, SSCI and AHCI mainly include articles and ISTP and ISSHP generally include proceedings papers.

Table 4.2: Number of documents per edition

Edition	Document Type			TOTAL
	Article	Proceedings	Other*	
SSCI	4,219	1	79	4,299
SCI	1,166	3	76	1,245
ESCI	69		3	72
AHCI	8			8
ISSHP		3,579		3,579
ISTP		71		71
2 Index	1,152	233	37	1,422
3+ Index	30	0	3	33
TOTAL	6,644	3,887	198	10,729

* Other includes: Abstracts, biographies, Book reviews, editorials, letters, news, reviews, and software reviews

Table 4.2 shows the distribution of the documents by each indexes. While most of the articles were indexed in SSCI and SCI, proceeding papers were mostly indexed in ISSHP. 63.50% of articles indexed in SSCI, 17.55% of articles indexed in SCI. 1,452 (17.34%) articles indexed in 2 or more indexes. These two indexes generally are SSCI and SCI. This situation reveals the eclectic nature of the educational sciences.

4.1.3 Distribution of research articles according to journals grouped by the 5-Year Impact Factor (5-YIF)

The articles were published in 839 different journals between 1968 and 2015. When looking at the journals' 5-Year Impact Factors, 752 journals were included in the Web of Science's 2017 JCR list, and 4,711 articles were published in those journals. Of these articles, 36.123% were published in journals with a 5-YIF of less than 1.00. In addition, 1,933 (29.094%) articles were published in journals not included in the 2017 JCR list.

Table 4.3: Distribution of articles for journals grouped by JCR 2017 5-YIF

5-YIF Range	# of Journals	# of Articles	%of Articles
4.01 >	58	205	3.085
3.51 - 4.00	33	63	0.948
3.01 - 3.50	53	187	2.815
2.51 - 3.00	88	229	3.447
2.01 - 2.50	132	430	6.472
1.51 - 2.00	146	707	10.641
1.01- 1.50	142	490	7.375
0.51 - 1.00	78	1,563	23.525
0.00 - 0.50	22	837	12.598
No Impact Value	87	1,933	29.094
TOTAL	839	6,644	100.000

Table 4.3 shows the distribution of articles according to journals grouped by the 2017 JCR 5-Year Impact Factor values. Also, see Appendix A for the full journal list and numbers of articles published that originated from Turkey. 29.094% of the articles were published in the journals that were not included in JCR anymore. These journals had been added to the index during the regional enlargement, yet failed to meet the necessary criteria and were subsequently removed from the index after 2012. 36.123% of the articles were published in Journals that have 5-YIF value less than 1.01. 27.935% of the articles published in the journals which have 5-YIF value between 1.01 and 3.00. Only 6.848% of the articles published in the journals which have 5-YIF value more than 3.01.

4.1.4 Distribution of research articles according to authors' institution type

Table 4.4: Distribution of articles by institution type

Institution Type	# of Institutions	# of Authors	# of Articles
University	167	13,457	6,093
Other*	286	918	463

Other includes institution types such as the Turkish Government, the MoNE, hospitals, or private companies etc.

Upon examining which institutions create knowledge and then share this knowledge through the publication of research articles, it is clear that universities are the main providers, as expected. Table 4.4 shows that most authors are working within universities, and that only 918 authors worked for institutions other than universities such as the Turkish Government, the MoNE, hospitals, or private companies etc.

Table 4.5: Distribution of articles by university type

University Type	# of Universities	# of Authors	# of Articles	Authors/Articles
State University	107	12,353	5,696	2.17
Foundation University	60	1,106	683	1.62

A total of 13,457 authors stated their affiliation as universities. When looking at university type, most authors were affiliated to state universities. However, when the Author-to-Article ratio is examined (see Table 4.5), the average number of authors per article was two (rounded), meaning that university type had no effect on the average number of authors per article.

4.1.5 Top 15 universities according to the numbers of published research articles

A subtotal of 3,542 articles (53.31% of the total number of articles) originated from 15 universities according to the stated author affiliations. For this reason, the current

research focused more deeply on those universities as the source of published articles. All of the top 15 producing institutions were notes as being state universities.

Table 4.6: Top 15 universities according to published research article numbers

#	University Type	University	City	# of Articles	# of Authors	% of Articles	Articles/Authors
1	STATE	HACETTEPE UNIVERSITY	Ankara	678	1,233	10.20	.55
2	STATE	GAZI UNIVERSITY	Ankara	440	746	6.62	.59
3	STATE	MIDDLE EAST TECHNICAL UNIVERSITY	Ankara	440	692	6.62	.64
4	STATE	ANKARA UNIVERSITY	Ankara	299	535	4.50	.56
5	STATE	MARMARA UNIVERSITY	Istanbul	248	433	3.73	.57
6	STATE	ANADOLU UNIVERSITY	Eskisehir	235	439	3.54	.54
7	STATE	DOKUZ EYLUL UNIVERSITY	Izmir	234	454	3.52	.52
8	STATE	KARADENIZ TECHNICAL UNIVERSITY	Trabzon	200	378	3.01	.53
9	STATE	ISTANBUL UNIVERSITY	Istanbul	192	422	2.89	.45
10	STATE	EGE UNIVERSITY	Izmir	181	472	2.72	.38
11	STATE	ATATÜRK UNIVERSITY	Erzurum	180	325	2.71	.55
12	STATE	SAKARYA UNIVERSITY	Sakarya	177	279	2.66	.63
13	STATE	PAMUKKALE UNIVERSITY	Denizli	169	284	2.54	.60
14	STATE	ABANT IZZET BAYSAL UNIVERSITY	Bolu	149	206	2.24	.72
15	STATE	AKDENIZ UNIVERSITY	Antalya	148	260	2.23	.57

Table 4.6 shows top 15 universities according to published research article numbers. The top four universities were located in Ankara, the capital of Turkey. Other than Ankara, the remaining 11 were located in Istanbul, Eskişehir, Izmir, Trabzon, Erzurum, Sakarya, Denizli, Bolu, Antalya, Konya, and Adana. Hacettepe University had the most articles with (n = 678, 10.20%), followed by Gazi University and Middle East Technical University which both published 440 articles (6.62%).

The Author/Article Ratio reports on the average number of authors who contributed to the articles. Of the top 15 universities, Abant Izzet Baysal University differed with a higher than average ratio of .72. This means that researchers at that university contributed more than researcher's affiliated to other universities. Conversely, the researchers from Ege University contributed the least to their articles with only a .38 Author/Article ratio.

Table 4.7 shows the journals in which the most research articles were published by researchers at the top 15 universities. Figure 4.2 clearly shows that 56% of the articles were published in just 12 journals. Of those, 14% of the articles were published in Egitim ve Bilim (Education & Science), 13% in Hacettepe Universitesi Egitim Fakultesi Dergisi (Journal of Hacettepe University Faculty of Education), and 10% of the articles were published in Kuram ve Uygulamada Egitim Bilimleri (Educational Sciences in Theory & Practice). See Appendix B for the full list of journals which the most productive 15 universities preferred.

5-YIF: 5 Year Impact Factor JIF: Journal Impact Factor AIS: Article Influence Score

Table 4.8 details the journals most preferred by CEIT departments with 5-5 Year Impact Factor, Journal Impact Factor and Article Influence Score. A total of 346 articles were published in 64 different publications by authors affiliated to CEIT departments.

As Figure 4.3 shows, almost 50% of these articles were published in just four publications, which were Kuram & Uygulamada Egitim Bilimleri (Educational Sciences in Theory & Practice), Computers & Education, Egitim ve Bilim (Education & Science), and Turkish Online Journal of Educational Technology.

Notably, the Turkish Online Journal of Educational Technology was only included in the JCR list for 2010 and 2011, and has since been removed. Therefore, the 36 articles shown as being published in the Turkish Online Journal of Educational Technology between 2008 and 2012 were in actuality attributed only to 2010-2011 when the journal was indexed in the Web of Science Core Collection.

– continued on Appendix D

A total of 609 articles were co-authored by researchers not affiliated to a Turkish institution, but from 71 other countries. As was expected, most of these authors were from

the United States of America, with 332 articles. Of these, 539 authors from 104 Turkish institutions worked in cooperation with 434 authors affiliated to 152 institutions in the United States of America. Second was the United Kingdom, with 69 authors from 37 institutions, and third was Germany with 33 authors from 18 institutions. Figure 4.4 illustrates the Turkish collaboration country map for the field of education according to the indexed articles in the Web of Science Core Collection between 1968 and 2015. Table 4.9 details the distribution of articles for the co-authorship distribution by country.

4.3.2 Research article co-authorship distribution for the top 15 universities

A total of 2,607 articles authored by more than one researcher originated from the top 15 universities located in Turkey (see Section 4.1.5). Overall, the articles were written by a total of 5,487 authors from 581 institutions. Some of these articles were written with cooperation from co-authors from 59 countries other than Turkey. The co-authorship pattern of the research articles indicates the knowledge sharing, interaction and collaboration between institutions, and also between countries. Table 4.10 details the distribution of articles for the top 15 universities according to co-authorship patterns. In the current research, co-authorship was deemed to mean the following;

- co-authorship of researchers within the same institution,
- co-authorship between researchers from different institutions in Turkey

- co-authorship between researchers from Turkey and other countries.

When Table 4.10 is examined, it can be seen that Middle East Technical University collaborates with authors from different countries more than the other universities, with 81 articles co-authored with 115 researchers from 75 institutions outside of Turkey. This was followed by Hacettepe University. On the other hand, Gazi University collaborated more with other universities within Turkey.

Table 4.11: Collaboration Coefficient for Top 15 Universities

University Name	Number of Authors																				Total	CC
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	17	20	42	50	80

ABANT İZZET BAYSAL UNIVERSITY	53	41	28	11	7	2	3	3					1								149	.408
PAMUKKALE UNIVERSITY	63	41	31	11	7	6	2	4	1	1								1	1		169	.408
SAKARYA UNIVERSITY	66	55	28	15	8	2		1			1								1		177	.386

The higher the Collaboration Coefficient (CC) value, the higher the level of collaboration between researchers. CC values approaching 1 denote significant levels of collaboration between authors. When looking at 4.11 CC values changed between .6 to .4, signifying a medium level of collaboration. Some articles had more than 20 authors listed, but these mainly medical-related articles that included information about adult learning related with disease and health.

In order not to misinterpret the results, the researcher reran the same analysis, but excluded 1,134 articles which had at least one author affiliated from an institution related to the medical sciences. Due to the nature of medical studies, there can often be a high number of collaborative authors for a single article. Table 4.12 therefore presents the CC values for collaborations that exclude medical-related articles. When the medical articles were excluded, the CC values of the universities changed. The resultant lower CC values shown in Table 4.12 range from .520 to .312.

Table 4.12: Collaboration Coefficient for Top 15 Universities that Exclude Medical-related Articles

University Name	Number of Authors															Total	CC
	1	2	3	4	5	6	7	8	9	10	12	13	14	17

PAMUKKALE UNIVERSITY	63	41	24	4		1	1	1							135	.312	

4.3.3 Research article co-authorship distribution by CEIT departments

In order to establish co-author relationships from the extracted data, analysis was conducted based on the address information declared by each author. A total of 346 articles were written from authors from CEIT departments in 64 of the publications. It should be kept in mind that some authors did not mention their department, and therefore such articles could not be included as having originated from a CEIT department. Table 4.13 and Table 4.14 show which universities' CEIT departments had more than five articles published as it was impossible to determine patterns of collaboration with such limited numbers of articles.

Table 4.13: Collaboration summary for CEIT departments that published 5 or more articles

University	Total# Articles (2+ Authors)	Same University	Different Institutions in Turkey			Non-Turkish Institutions			
		# of Authors	# of Articles	# of Institutions	# of Authors	# of Articles	# of Countries	# of Institutions	# of Authors
MIDDLE EAST TECHNICAL UNIVERSITY	43	50	24	17	30	11	4	9	15
HACETTEPE UNIVERSITY	38	42	12	8	15	3	1	1	3
ATATÜRK UNIVERSITY	22	25	18	14	26	1	1	1	1
GAZI UNIVERSITY	18	19	15	15	21	1	1	1	1
ANADOLU UNIVERSITY	17	26	5	5	5	0	0	0	0
ANKARA UNIVERSITY	15	17	11	10	11	0	0	0	0
KARADENİZ TECHNICAL UNIVERSITY	10	15	7	6	9	0	0	0	0
BAŞKENT UNIVERSITY	9	11	5	5	6	0	0	0	0
DOKUZ EYLÜL UNIVERSITY	9	11	7	7	10	0	0	0	0
KOCAELİ UNIVERSITY	8	11	2	2	3	1	1	1	1
NEAR EAST UNIVERSİTESİ	7	8	3	2	4	0	0	0	0
ULUDAĞ UNIVERSITY	7	13	2	2	2	2	1	1	2
YILDIZ TEKNİK UNIVERSITY	7	8	4	4	4	0	0	0	0
SAKARYA UNIVERSITY	6	8	2	2	2	0	0	0	0
KIRIKKALE UNIVERSITY	6	13	2	2	2	0	0	0	0
EGE UNIVERSITY	5	5	3	4	5	0	0	0	0
AKDENİZ UNIVERSITY	5	6	5	5	8	0	0	0	0
SELÇUK UNIVERSITY	5	8	2	2	2	1	1	1	1

Table 4.13 summarizes the collaboration pattern of CEIT departments that published 5 or more articles. It can be seen that researchers from Middle East Technical University published more articles in collaboration with authors from nine other countries. Different than the top 15 universities, when considering only the CEIT departments, it can be seen that Atatürk University originated 22 articles indexed in the Web of Science Core collection, ranking the university in third place.

Table 4.14: Collaboration Co-efficiency (CC) for CEIT departments that published 5 or more articles

University	Number of Authors							Total Articles	CC
	1	2	3	4	5	6	7		
AKDENİZ UNIVERSITY			3	1	1			5	.710
ATATÜRK UNIVERSITY	1	3	8	4	5		2	23	.676
MIDDLE EAST TECHNICAL UNIVERSITY	3	22	13	3	5			46	.563
KOCAELİ UNIVERSITY		6	1		1			8	.558
ULUDAĞ UNIVERSITY	1	3	2		1	1		8	.558
NEAR EAST UNIVERSITESI	1	4	1	1		1		8	.531
KARADENİZ TECHNICAL UNIVERSITY	2	4	5		1			12	.511
YILDIZ TEKNİK UNIVERSITY	1	4	3					8	.500
HACETTEPE UNIVERSITY	5	26	9	2	1			43	.495
ANKARA UNIVERSITY	1	14	1					16	.479
KIRIKKALE UNIVERSITY	2	2	3		1			8	.475
BAŞKENT UNIVERSITY	2	5	4					11	.470
ABANT İZZET BAYSAL UNIVERSITY	1	2	2					5	.467
EGE UNIVERSITY	2	2	2		1			7	.448
DOKUZ EYLÜL UNIVERSITY	3	6	1	2				12	.431
GAZI UNIVERSITY	7	9	8	1				25	.423
ANADOLU UNIVERSITY	8	9	3	2		2	1	25	.421
ÇUKUROVA UNIVERSITY	2	1	1		1			5	.393
BAHÇEŞEHİR UNIVERSITY	2	3	1					6	.361
SELÇUK UNIVERSITY	4	2	2			1		9	.352
SAKARYA UNIVERSITY	6	4	2					12	.278
SÜLEYMAN DEMİREL UNIVERSITY	4	2	1					7	.238

Table 4.14 presents the CC values for CEIT departments that published 5 or more articles. It can be seen that there are Akdeniz University CEIT department originated only 5 articles however these articles have at least 3 or more authors. Due to this reason, Akdeniz University has the greatest CC values. Ataturk University ranking in the second place, with 22 articles and .676 CC values. Middle East Technical University ranking in the third place with 46 articles and .563 CC values.

Table 4.15: Collaboration Coefficiency (CC) distribution by year

Years	Number of Authors							Total Articles	CC
	1	2	3	4	5	6	7		
2000-2003	2	0	0	0	0	0	0	2	0
2004-2006	1	2	2	0	0	0	0	5	.467
2007-2009	21	35	12	4	2	1	1	76	.418
2010-2012	41	53	24	3	4	2	2	129	.398
2013-2015	23	53	41	7	8	1	1	134	.501

Table 4.15 showed the yearly distribution of the Collaboration Coefficiency. It was seen that articles were started to written after 2000; as it was the year that CEIT departments gave their first graduates. In Years, when the graduate student numbers were increase, the interaction between authors from CEIT departments increases gradually. In addition, in 2002 CoHE have started the Faculty Development Programme (ÖYP). This program also increase the collaboration between academicians in CEIT departments.

CHAPTER 5

CONCLUSION AND DISCUSSION

Bibliometric analysis methods were used in the current study to understand the current trends in the educational research field in Turkey. The research questions were formulated primarily to focus on the publication demographics, institutional contributions to the field of education, and co-author collaborative writing activities. In this chapter, the results are discussed based on the findings presented in Chapter 4.

5.1 Results

5.1.1 General Publication Trends and Bibliometric Profiles of Research Documents and Journals

The result of the general publication trends and bibliometric profiles of publications included the distribution of documents according to year, according to each index, according to journals grouped by the 5-Year Impact Factor (5-YIF) and according to authors' institution type. Figure 4.1 showed the clear effect of the Web of Science' enlargement decision. After 2006, the number of articles increased incrementally; on the other hand, after 2012, the number of items published started to decline. The most significant reason for this decrease was that WOS was not precisely examining all of the journals and accepted more journals following their enlargement decision, but was then forced to largely abandon that course. As mentioned previously, there were only seven journals originally, and then between 2005 and 2010 a total of 68 journals were added to the Web of Science databases (Testa, 2011).

Distribution of documents according to each index examined how the research doc-

uments were distributed between the various indexes. Academic documents were mostly indexed in the SSCI database, and secondly in the SCI database, which was as expected. On the other hand, there were also documents indexed in other databases or that had been indexed in more than one database. This result was ascribed to the eclectic nature of the educational research field.

The researcher analyzed the characteristics of the journals where Education and Educational Research articles had been published by academics affiliated to Turkey. Table 4.3 showed that 30% of the journals were no longer included in the JCR list. Mostly, these journals had been added to the index during the regional enlargement, yet failed to meet the necessary criteria and were subsequently removed from the index after 2012. Looking at Table A.1 in Appendix A, it is clear that three journals in the top five, in terms of numbers of articles published, were not placed on the JCR list.

Although yearly distribution of the documents showed an increase in number of publications, the quality of research emanating from Turkey was questionable as the articles had mostly been published in journals which had low or even no calculated impact value. In knowledge economy, reaching and disseminating new technology and information is considered a valuable asset. Policymakers should consider this issue and take the necessary precautions if their country wishes to be seen as well-placed in the knowledge world.

5.1.2 Results According to Authors' Institution

Table 4.4 showed the distribution of the authors' institutions. Accordingly, 93.61% of authors were from universities, with just 6.39% from other institutions like the Turkish Government, the Ministry of National Education, hospitals, and private companies. According to Tezcan and Yanıktepe (2006)

73.12% of the researchers in Turkey is from higher education in spite of that around 40% of researcher in EU-25 (Science and technology in Europe, 2006, ISSN 1725-5821, Office for Official Publications of the European Communities). Comparing the values between EU-25 and TR, It is obvious that the number of researchers in private sectors in TR is quite lower than EU-25. This is because of the low level of awareness for science and technology within private sector. Parallel to this, the companies are not

considering the R&D and innovation activities as their major source of competitiveness.
(p. 273)

In the current study, from the field of education, the percentage of researchers from the private sector, the MoNE, or the Turkish Government was found to be much less than reported by Tezcan and Yanıktepe (2006). In the private sector, Table 4.5 showed how small the impact was of foundation universities in the educational research field between 1968 and 2015 when compared to that of the state universities, with only 1,106 out of 13,457 researchers affiliated to foundation (private) universities. However, the Author/Article ratio, which represents the number of authors per article, showed that foundation university researchers worked on publication writing more than researchers from state universities.

Table 4.6 showed that the top four universities were located in Ankara, indicating that the heart of the educational research field in Turkey is based in Ankara. One reason for this may be that the Ministry of National Education (MoNE) is situated in Ankara, which perhaps helped researchers to conduct their research easier and to follow-up applications for research permission more readily. The Higher Education Law, which was enacted on November 6, 1981 (Law No: 2547), moved teacher education away from the MoNE to the responsibility of universities. Also, most of these top 15 academic research producing universities were considered to be important resources of teacher training prior to 1982, and this state of affairs is still largely the case.

5.1.3 Bibliometric Profile of Journals Originating from the Top 15 Universities and CEIT Departments

Journals most preferred by the top 15 universities and CEIT departments addressed the bibliographic profile of the journals published from the Top 15 Universities and CEIT departments, in terms of the volume of academic research published. Analysis showed that in both cases, the publications were limited to a low number of journals and that the impact values of those journals were either low, had a zero impact value, or were journals having since been removed from the JCR listing. Out of 40 countries, Turkey was placed fifth in terms of the number of articles published in the field of

instructional design and technology between 2007 and 2017 (Bodily, Leary, & West, 2019).

Actually, the overall trend for Turkey in the educational research field has seen an impressive improvement in numerical terms. Incentive programs that have focused more on the quantity of articles rather than their quality can clearly be seen. On the other hand, as shown in Figure ??, after 2012, a downward trend has been seen in the numbers of articles being published. In order to halt this downward trend, policymakers should take the necessary action in order to improve not only the quantity, but also the quality of the articles being published by academicians in Turkey.

5.1.4 Collaboration

Collaboration trends among researchers related to collaborative research patterns in the education and educational research subject field in Turkey. According to Yetkin et al. (2015a), the top three countries which cooperated academically with Turkey in the social sciences field between 2010 and 2015 were the United States of America, the United Kingdom, and the Netherlands.

Distribution of co-authorship by country showed that in the Education and Educational Research subject area, this trend has not changed. Table 4.9 showed that the top three most common sources of co-authors in the current study were from the United States of America, the United Kingdom, and from Germany, with the Netherlands in fourth place. It is important to note that the report by Yetkin et al. (2015b) also stated that 15.73% of scientific publications in the social sciences had been produced with the cooperation of other countries. However, in the current study, for the education and educational research subject field, only 9.1% of the articles were prepared with the cooperation with authors from countries other than Turkey.

5.2 Limitation of the Study

Bibliometric studies always effected from the advers effects of bibliometry. These adverse effect listed in Section. 2.5 as

- Publishing in Journals that Count
- Salami Publishing and Self-Plagiarism
- Honorary Authorship
- Self-citations
- Increasing the Journal Impact Factor
- Cumulative or Personal Impact Factors

In addition to these adverse effects, the researcher's productivity is also affected by the academic load of academicians, number of different courses given by one academician, number of academic staff in the faculty, their motivations, etc. Please consider this data with the lenses which we believe these issues have great impact on researchers' productivity. The current study are not taking into account all these aspects. Only the number of articles were used when determining productive universities and departments.

5.3 Suggestions for Further Research

In the current study, citation data were excluded from the research design scope. Based on this, the international impact of the published articles was not analyzed in the current study, with the data having been descriptively examined only. Including citation data would provide additional information about the impact of the educational articles originating from Turkey. Moreover, in the current research, other bibliometrical sources such as Scopus or Google Scholar were purposely excluded (see Section 3.3). These have become more widely used in recent years, and it could therefore be suggested to conduct the same research also including the other bibliometric sources in order to show a more comprehensive picture of educational research trends in Turkey.

In addition, the researcher grouped the published articles according to the authors' stated departmental affiliations, and analyzed only 346 articles which originated from CEIT departments. Due to research time restraints, the researcher was unable to apply

text mining methods, instead relying upon the raw data extracted from the indexing databases, albeit with a certain degree of data cleansing applied (see Section 3.6). It was clear that some authors had not affiliated their departments. Therefore, further research using text mining methods to improve the classification of instructional technology-related articles would likely produce a more accurate analysis about the current instructional technology research trends in Turkey.

Finally, in addition to considering the use of text mining techniques, it could also be pertinent to conduct content analysis along with text mining methods in order to analyze the research design patterns to highlight researchers' academic tendencies in their studies of the instructional design field.

Appendix A

APPENDIX A

Table A.1 presents the list of journals that were searched for articles originating from Turkey. The “# of Articles” column indicates the total number of articles published in the respective journals between 1968 and 2015. Table A.1 also shows the JCR 2017 values for 5-year Impact Factor (5-YIF), Journal Impact Factor (JIF), and Article Influence Score (AIS).

The use of “-” indicates a journal not included in the JCR 2017 list.

Table A.1: Journal list with JCR values
